To compensate for this advantage, when property passing under a settlement made after the act pays the estate duty, a further duty of 2% (settlement estate duty) is taken, except where the only subsequent life-interest is that of the wife or husband of the deceased.

The rate of duty being fixed according to the aggregate capital value of the whole estate, the charge is distributed according to the different modes of disposition of the property comprised in the estate. The duty on the personality which passes to the executor as such is paid by him, as the probate duty was, and comes out of the general estate. For the other property passing, trustees, or any person to whom it passes for a beneficial interest in possession, are made accountable, and are required to bring in an account of the property and pay the duty. The duty is a first charge on such property, and, when it is paid by a person having a life-interest only, is a first charge on the property for the life-interest.

The duty on real property included in an account is payable by eight yearly or sixteen half-yearly instalments, becoming due twelve months after the death, and bearing interest at 3% from that date. On other property, except in a few special cases, the duty bears interest at 3% from the date of the death. When the estate duty has been paid no further duty is chargeable on property comprised in the estate which passes to lineal relations of the deceased. But on property passing to collaterals or strangers on legacy or succession duty, as the case may be, is payable by the devisees or successors, at a rate (which is the same whichever duty be payable) fixed according to consanguinity.

For a detailed account of the provisions of the act of 1894 and subsequent amending acts, and of the practical working of the duty, reference is made to Austin-Cartmill, *Finance Acts* (1894-1907); Hanson, *Death Duties* (London, 1904); Soward, *Handbook to the Estate Duty* (4th ed., London, 1900); and to the reports of the commissioners of Inland Revenue for 1894-1895 and subsequent years.

**ESTCOURT, RICHARD** (1668-1712), English actor, began by playing comedy parts in Dublin. His first London appearance was in 1704 as Dominick, in Dryden's *Spanish Frier*, and he continued to take important parts at Drury Lane, being the original Pounce in Steele's *Tender Husband* (1705), Sergeant Kite in Farquhar's *Recruiting Officer*, and Sir Francis Gripe in Mrs Centlivre's *Bussybody*. He was an excellent mimic and a great favourite socially. Estcourt wrote a comedy, *The Fair Example*, or the *Malignant Citizen* (1703), and *Prunella* (1704), an interlude.

**ESTE**, one of the oldest of the former reigning houses of Italy. It is in all probability of Lombard origin, and descended, according to Muratori, from the princes who governed in Tuscany in Carolingian times. The lordship of the town of Este was first acquired by Alberto Azzo II., who also bore the title of marquis of Italy1 (d. c. 1097); he married Kunitza or Kuncenda, sister of Welf or Gueph III., duke of Carinthia. Welf died without issue, and was succeeded by Welf IV., son of Kunitza, who married a daughter of Otto II., duke of Bavaria, and who obtained the duchy of Bavaria in 1079. Through him the house of Este became connected with the princely houses of Brunswick and Hanover, from which the sovereigns of England are descended. The Italian titles and estates were inherited by Folco I. (1068-1133), son of Alberto Azzo by his second wife Gerasenda, daughter of Herbert I., count of Maine.2 The house of Este played a great part in the history of medieval and Renaissance Italy, and it first comes to the front in the wars between the Guelphs and Ghibellines; as leaders of the former party its princes received at different times Ferrara, Modena, Reggio and other cities and territories.

Obizzo I., son of Folco, was the first to bear the title of marquis of Este. He entered into the Guelphic league against the emperor Frederick I., and was comprehended in the treaty of Venice of 1177 by which municipal *podestàs* (foreigners chosen as heads of cities to administer justice impartially) were instituted. He was elected podestà of Padua in 1178, and in 1184 he was reconciled with Frederick, who created him marquis of Genoa and Milan, a dignity somewhat similar to that of imperial vicar. By the marriage of his son Azzo to the heiress of the Marchesella family (the story that she was carried off to prevent her marrying an enemy of the Este is a pure legend), he came to acquire great influence in Ferrara, although he was opposed by the hardly less powerful house of Torelli.

Obizzo died in 1204 and Azzo V. having predeceased him, the marquisate devolved on his grandson Azzo VI. (1270-1212), who became head of the Guelph party, and to him the people of Ferrara sacrificed their liberty by making him their first lord (1208). But during his lifetime civil war raged in the city, between the Este and the Torelli, each party being driven out again and again. Azzo (also called Azzolino) died in 1212 and was succeeded by Aldobrandino I., who in 1213 concluded a treaty with Salinguerra Torelli, the head of that house, by which the Este were to divide the government of the city between them. On his death in 1215 he was succeeded by his brother Azzo VII. (1205-1264), surnamed Novello, but Salinguerra Torelli usurped all power in Ferrara and expelled Azzo (1222). In 1240 Pope Gregory IX. determined on another war against the emperor Frederick II., but deemed it wise to begin by crushing the chief Ghibelline houses. Thus Azzo found himself in league with the pope and the Guelph cities in his attempt to regain Ferrara. The town underwent a four months' siege, and was at last compelled to surrender; Salinguerra was sent to Venice as a prisoner, and Azzo ruled in Ferrara once more. The Ghibelline party was annihilated, but the city enjoyed peace and happiness within, although her citizens took part in the wars raging outside. The Guelph cause triumphed, Frederick being defeated several times, and after his death Azzo helped in crushing the terrible *Eccelino da Romano* (q.v.) who upheld the imperial cause, at the battle of Cassano (1250). He died in 1264 and was succeeded by Obizzo II. (1240-1293) his grandson, who in 1288 received the lordship of Modena, and that of Reggio in 1280. He was a capable but cruel ruler, and while professing devotion to the Guelph cause, did homage to the German king Rudolph I. when he descended into Italy.

Obizzo II. died in 1293 and was succeeded by his son Azzo VIII., but the latter's brothers, Aldobrandino and Francesco, who were to have shared in the government, were expelled and became his bitter enemies. The misgovernment of Azzo led to the revolt of Reggio and Modena, which shook off his yoke. Enemies arose on all sides, and he spent his last years in perpetual fighting. He died in 1308, and having no legitimate children, his brothers, his natural son Fresco, and others disputed the succession. A papal legate was appointed, and though the Este returned they were placed under pontifical tutelage.

The history of the house now becomes involved and of little interest until we come to Nicholas III. (1354-1444), who exercised sway over Ferrara, Modena, Parma and Reggio, waged many wars, was made general of the army of the Church, and in his later years governor of Milan, where he died, not without suspicion of poison. To him succeeded Lionello (1407-1459), a wise and virtuous ruler and a patron of literature and art; then Borso (1415-1451), his brother, who was created duke of Modena and Ferrara by the emperor Emmanucl III., and duke of Ferrara by the pope. In spite of the wars by which all Italy was torn, Ferrara enjoyed a period of peace and prosperity under Borso; he patronized literature, established a printing-press at Ferrara, surrounded himself with learned men, and his court was of

2 Another son of Azzo and Gerseenda became count of Maine as Hugh III. (d. 1131).
unparalleled splendour. He also protected industry and commerce, and ruled with great wisdom. His brother Ercole I. (1431–1509), who succeeded him in 1471, was less fortunate, and had to engage in a war with Venice, owing to a dispute about the salt monopoly, with the result that by the peace of 1484 he was forced to cede the district of Polesine to the republic. But the last years of his life were peaceful and prosperous, so that afterwards men looked back to the days of Ercole I. as a golden age; his capital was noted both for its luxury and as the resort of men eminent in literature and art. Bolognino the poet was his minister, and Ariosto obtained his patronage.

Ercole's daughter Beatrice d'Este (1475–1507), Duchess of Milan, one of the most beautiful and accomplished princesses of the Italian Renaissance, was betrothed at the age of five to Lodovico Sforza (known as il Moro), Duke of Bari, regent and afterwards duke of Milan, and was married to him in January 1491. She had been carefully educated, and availed herself of her position as mistress of one of the most splendid courts of Italy to surround herself with learned men, poets and artists, such as Niccolò da Correggio, Bernardo Castiglione, Bramante, Leonardo da Vinci and many others. In 1492 she visited Venice as ambassador for her husband in his political schemes, which consisted chiefly in a desire to be recognized as duke of Milan. On the death of Gian Galeazzo Sforza, Lodovico's usurpation was legalized, and after the battle of Fornovo (1495) both he and his wife took part in the peace congress of Vercelli between Charles VIII. of France and the Italian prunes, at which Beatrice showed great political ability. But her brilliant career was cut short by death through childbirth, on the 3rd of January 1497. She belongs to the best class of Renaissance women, and was one of the culture influences of the age; to her patronage and good taste are due a great extent the splendour of the Castello of Milan, of the Certosa of Pavia and of many other famous buildings in Lombardy.

Her sister Isabella d'Este (1474–1559), marchioness of Mantua, was carefully educated both in letters and in the arts like Beatrice, and was married when barely sixteen to Francesco Gonzaga, marquis of Mantua (1490). She showed great diplomatic and political skill, especially in her negotiations with Cesare Borgia (q.v.), who had dispossessed Guidobaldo da Montefeltro, duke of Urbino, the husband of her sister-in-law and intimate friend Elisabetta Gonzaga (1502). She received the deposed duke and duchess, as well as other princes in the same condition, at her court of Mantua, which was one of the most brilliant in Italy, and like her sister she gathered together many eminent men, artists, and writers. One of these was Giulio Romano being among those whom she employed. Both she and her husband were greatly influenced by Baldassare Castiglione (1478–1529), author of Il Cortigiano, and it was at his suggestion that Giulio Romano was summoned to Mantua to enlarge the Castello and other buildings. Isabella was "undoubtedly, among all the princesses of the 15th and 16th centuries, the one who most strikingly and perfectly personified the aspirations of the Renaissance" (Eugène Münster); but her character was less attractive than that of her sister, and in her love of collecting works of art she showed a somewhat grasping nature, being ever anxious to cut down the prices of the artists who worked for her.

To Ercole I. succeeded his son Alfonso I. (1486–1534), the husband of Lucrezia Borgia (q.v.), daughter of Pope Alexander VI. During nearly the whole of his reign he was engaged in the Italian wars, but by his diplomatic skill and his military ability he was for many years almost always successful. He was gifted with great mechanical skill, and his armament was of world-wide reputation. On the formation of the league of Cambrai against Venice in 1508, he was appointed to the supreme command of the papal troops by Julius II.; but after the Venetians had sustained a number of reverses they made peace with the pope and joined him against the French. Alfonso was invited to co-operate in the new combination, and on his refusal war was declared against him; but although he began by losing Monza and Reggio, he subsequently inflicted several defeats on the papal troops. He fought on the side of the French at the battle of Ravenna (1512), from which, although victorious, they derived no advantage. Soon afterwards they retired from Italy, and Alfonso, finding himself abandoned, submitted to the pope, who restored him to his fiefs. He made peace with the pope, through the mediation of Fabrizio Colonna. He went to Rome for the purpose and received absolution, but on discovering that Julius meant to detain him a prisoner, he escaped in disguise, and the pope's death in 1513 gave him a brief respite. But Leo X. proved equally bent on the destruction of the house of Este, when he too was cut off by death. Alfonso availed himself of the troubles of the papacy during the reign of his successor, and actually hostile Clement VII. to capture Reggio (1522) and Modena (1527), and was confirmed in his possession of them by the emperor Charles V., in spite of Clement's opposition.

He died in 1534, and was succeeded by his son Ercole II. (1508–1559), who married Renée, daughter of Louis XII. of France, a princess of Protestant proclivities and a friend of Calvin. On joining the league of France and the papacy against Spain, Ercole was appointed lieutenant-general of the French army in Italy. The war was prosecuted, however, with little vigour, and peace was made with Spain in 1528. The duke and his brother, Cardinal Ippolito the Younger, were patrons of literature and art, and the latter built the magnificent Villa d'Este at Tivoli. He was succeeded by Alfonso II. (1553–1597), remembered for his patronage of Tasso, whom he afterwards imprisoned. He reorganized the army, enriched the public library, encouraged agriculture, but was extravagant and dissipated. With him the main branch of the family came to an end, and although at his death he bequeathed the ducy to his cousin Cesare (1533–1628), Pope Clement VIII., renewing the Church's hostility to the house of Este, declared that prince to be of illegitimate birth (a doubtful contention), and by a treaty with Lucrezia, Alfonso's sister, Ferrara was made over to the Holy See. Cesare held Modena and Reggio, but with him the Esteensi cease to play an important part in Italian politics. For two centuries this dynasty had been one of the greatest powers in Italy, and its course was perhaps the most splendid in Europe, both as regards pomp and luxury and on account of the eminent artists, poets and scholars which it attracted.

The subsequent heads of the family were: Alfonso III., who retired to a monastery in 1629 and died in 1644; Francis I. (1610–1698), who commanded the French army in Italy in 1647; Alfonso IV. (1646–1662), the father of Mary Beatrice, the queen of James II. of England, who fought in the French army during the Spanish War, and founded the picture gallery at Modena; Francis II. (1663–1704), who also built a library, also at Modena, and founded the university; Rinaldo (1655–1737), through whose marriage with Charlotte Felicitas of Brunswick-Lüneburg the long-separated branches of the house of Este were reunited; Francis III. (1698–1780), who married the daughter of the regent Philip of Orleans. Francis III. wished to remain neutral during the war between Spain and Austria (1740), but the imperialists having occupied and devastated his duchy, he took the Spanish side and was appointed generalissimo of the Spanish army in Italy. He was re-established in his possessions by the treaty of Aix-la-Chapelle (1748), and on being reconciled with the empress Maria Theresa, he received from her the title of governor of Lombardy in 1754. With his son Ercole III. Rinaldo (1777–1803), who at the peace of Campoformio lost his duchy, the male line of the Esteensi came to an end. His only daughter, Marie Beatrice (d. 1836), was married to the archduke Ferdinand, third son of the emperor Francis I. Ferdinand was created duke of Breisgau in 1803, and at his death in 1806 he was succeeded by his son Francis IV. (q.v.), to whom the duchy of Modena was given at the treaty of Vienna in 1814. He died in 1846 and was succeeded by Francis V. (q.v.), who lost his possessions by the events of 1859. With his death in 1875 the title and estates passed to the archduke Francis Ferdinand, heir to the Austro-Hungarian throne. The children of Lady Augusta Murray, daughter of the earl of Dunmore, by marriage with Archduke Maximilian, son of George III. of Great Britain, assumed the old name of
d'Este, and claimed recognition as members of the royal family; but as the marriage was in violation of the royal marriages act of 1773, it was declared invalid, and their claims were set aside.

ESTE (anc. Ateste, q.v.), a town and episcopal see of Venetia, Italy, in the province of Padua, 20 m. S.S.W. of it by rail. (Pop. 1901) 8671 (town); 16,770 (commune). It lies 450 ft. above sea-level below the southern slopes of the Euganean Hills. The external walls of the castle still risible above the town on the N., but the present dwelling is occupied by the castle-museum of the once enormous Palazzo Mocenigo, of the 16th century, is now occupied by the important archaeological museum (see ATESTE). The cathedral was erected in 1600-1720, on the site of an older building destroyed by an earthquake in 1688. S. Martino is a church in the Lombard Romanesque style. The archives in the Palazzo Comunale are important.

After the Roman period the history of the Este is a blank until the 13th century, in which time they were the allies of Monselese. In the 10th century the family of Este (see above) established itself in the castle above the town. At the end of the 13th century Padua, which had already captured Este more than once, became definitely mistress of it. When the Carrara family succumbed in 1405, Este voluntarily surrendered to Venice and was allowed its independence, under a podestà; and thenceforth it followed the fortunes of Venetia.

ESTÉ-CALDERÓN, SERAFÍN (1709-1867), a Spanish author, best known by the pseudonym of "El Solitario," was born at Málaga on the 27th of December 1709. His first literary effort was El Listón verde, a poem signed "Sainín" and written to celebrate the revolution of 1820. He was called to the bar, and settled for some time at Madrid, where he published a volume of verses in 1831 under the assumed name of "El Solitario." He obtained an exaggerated reputation as an Arabic scholar, and played a minor part in the political movements of his time. He died at Madrid on the 5th of February 1867. His most interesting work, Escenas andaluzas (1847), is in a curiously affected style, the vocabulary being partly archaic and partly provincial; but, despite its eccentric mannerisms, it is a vivid record of picturesque scenes and local customs. Estébanez Calderón is also the author of an unfinished history, De la conquista y pérdida de Portugal (1883), posthumously under the editorship of his nephew, Antonio Cánovas del Castillo.

Este, a town of northern Spain, in the province of Navarre, on the left bank of the river Ega, 15 m. W.S.W. of Pamplona. Pop. (1900) 5736. Estella, which occupies the site of a Roman town of uncertain name, contains several monasteries and churches, a medieval citadel, and a college which was formerly a university. Its principal industries are the manufacture of woolen and linen fabrics and brandy-making; and it has a considerable trade in fruit, wine and cattle. Estella commands several defiles on the roads from Castile and Aragon, and on that account occupies a position of considerable strategic importance. It was long the headquarters of Don Carlos, who was proclaimed king here in 1833. In 1873 it was the chief stronghold of the Carlists, and in 1874, when driven from other places, they succeeded in retiring to Estella. On the 16th of February 1876 the Carlists in the town surrendered unconditionally. For an account of the Carlist rising see SPAIN: History.

ESTÉRHAZY OF GALÁNTA, a noble Magyar family. Its origin has been traced, not without some uncertainty, to Salamon of Estoras, whose sons Péter and Ilyés divided their patrimony in 1238. Péter founded the family of Zéhák, and Ilyés that of Ilyésházy, which became extinct in the male line in 1836. The first member of the family to emerge definitely into history was Ferencz Zéhák (1583-1604), vice lord-lieutenant of the county of Pressburg, who took the name of Estéraży when he was created Freiherr of Galántha, an estate acquired by the family in 1421. His eldest son, Dániel (d. 1654), founded the house of Cseskneek, the third, Pál (d. 1641), the line of Zőlyom (Altsohl), and the fourth, Miklós, that branch of family which occupies the most considerable place in Hungarian history, that of Fraknó or Forchtenstein.

This Miklós [Nicholas] ESTÉRHAZI of Galántha (1582-1645) was born at Galántha on the 8th of April 1582. His parents were Protestants, and he himself, at first, followed the Protestant persuasion; but he subsequently went over to Catholicism and, along with Cardinal Pázmány, his most serious rival at court, became a pillar of Catholicism, both religiously and politically, and a worthy opponent of the two great Protestant champions of the time, Gabriel Bethlen and George I. Rákóczi. In 1611 he married Orsolya, the widow of the wealthy Ferencz Múgosi, and thus came into possession of the large manor of Krems and in 1622 he acquired Fraknó. Matthias II. made him a baron (1615), count of Beregh (1617), and lord-lieutenant of the county of Zőlyom and magister curiae regiae (1618). At the coronation of Ferdinand II., when he officiated as grand-standard-bearer, he received the order of the Golden Fleece and fresh donations. At the diet of Sopron, 1625, he was elected palatine of Hungary. As a diplomatist he powerfully contributed to bring about the peace of Nikischburg (1629) and the peace of Linn (1645) (see HUNGARY: History). His political ideal was the consolidation of the Habsburg dynasty as a means towards freeing Hungary from the Turkish yoke. He himself, on one occasion (1623), defeated the Turks on the banks of the Nyitra; but anything like sustained operations against them was then impossible. He was also one of the most eminent writers of his day. He died at Nagy-Heßlán on the 11th of September 1645, and was succeeded by his three sons.

See Works of Nicholas Estéhazy, with a biography by Ferencz Toldi (Hung.) (Pest, 1852); Nicholas Csmn Elléházy, Palatine of Hungary (a biography, Hung.) (Pest, 1863-1870).

Estéhazy, Ferdinand Pál, Prince (1563-1713), prince palatine, founded the princely branch of the family of Estéházy. He was born at Kis Marton (Eisenstadt) on the 7th of September 1635. In 1663 he fought, along with Miklós Zrínyi, against the Turks, and distinguished himself under Montecuccoli. In 1667 he was appointed commander-in-chief in south Hungary, where he defeated the malcontents at Leutschau and Göyör. In 1681 he was elected palatine. In 1683 he participated in the deliverance of Vienna from the Turks, and entered Buda in 1686 at the head of 20,000 men. Therapeutically reactionary, and absolutely devoted to the Habsburgs, he contributed more than any one else to the curtailing of the privileges of the Magyar gentry in 1687, when he was created a prince of the Empire, with (in 1712) succession to the first-born of his house. His "austic tendencies" made him so unpopular that his offer of mediation between the Rákóczi insurgents and the government was rejected by the Hungarian diet, and the negotiations, which led to the peace of Sárospatak (see HUNGARY: History), were concluded at Jászberény.

He died on the 26th of March 1713. He loved the arts and sciences, wrote several religious works, and was one of the chief compilers of the Tropheum Domus Inclytae Estoriciianae. See Lajos Merényi, Prince Paul Estéházy (Hung.) (Budapest, 1865).

Prince Pál Antal, grandson of the prince palatine Pál, was a distinguished soldier, who rose to the rank of field-marshall in 1758. On his death in 1762 he was succeeded by his brother.
Esters

Prince Miklós József [Nicholas Joseph] (1734–1790), also a brilliant soldier, is perhaps best remembered as a patron of the fine arts. For his services in command of an infantry brigade at Koln (1757) he was specially mentioned by Count Daun, and became one of the original members of the order of Maria Theresa. In 1762 he was appointed captain of Maria Theresa’s Hungarian bodyguard, in 1764 Feldzeugmeister, and in 1768 field marshal. His other honors included the Golden Fleece and the grade of commander in the order of Maria Theresa. Joseph II decreed the princely title, which had previously been limited to the eldest-born of the house, on all his descendants, male and female. Esterházy died in Vienna on the 28th of September 1790. He rebuilt in the Renaissance style Schloss Esterházy, the splendor of which won for it the name of the Hungarian Versailles. Haydn was for thirty years conductor of his private orchestra and general musical director, and many of his compositions were written for the private theatre and the concerts of this prince.

His grandson, Prince Miklós [Nicholas] (1765–1833) was born on the 12th of December 1765. He began life as an officer in the guards, subsequently making the grand tour, which first awakened his deep interest in art. He quitted the army for diplomacy after reaching the rank of Feldzeugmeister, and was employed as extra-ordinary ambassador, on special occasions, when he displayed a magnificence extraordinary even for the Esterházys. He made at Vienna an important collection of paintings and engravings, which came into, the possession of the Hungarian Academy at Budapest in 1865. At his summer palace of Kis Marton (Eisenstadt) he erected a monument to Haydn. His immense expenditure on building and the arts involved the family in financial difficulties for two generations. When the French invaded Austria in 1797, he raised a regiment of 1000 men at his own expense. In 1809, when Napoleon invited the Magyars to elect a new king to replace the Habsburgs, overtures were made to Prince Nicholas, who refused the honour and, further, raised a regiment of volunteers in defence of Austrian interests. He died at Como on the 24th of November 1833.

His son, Prince Pál Antal [Paul Anthony] (1786–1860), entered the diplomatic service. In 1806 he was secretary of the embassy in London, and in 1807 worked with Prince Metternich in the same capacity in Paris. In 1810 he was accredited to the court of Dresden, where he tried in vain to detach Saxony from Napoleon, and in 1814 he accompanied his father on a secret mission to Rome. He took a leading part in all the diplomatic negotiations consequent upon the wars of 1813–1815, especially at the congress of Châtillon, and on the conclusion of peace was, at the express desire of the prince regent, sent as ambassador to London. In 1824 he represented Austria as ambassador extraordinary at the congress of Charles X., and was the premier Austrian commissioner at the London conferences of 1820–1826. By 1844 he quitted diplomacy for politics and attached himself to the “free-principles party.” He was minister for foreign affairs in the first responsible Hungarian ministry (1848), but resigned his post in September because he could see no way of reconciling the court with the nation. The last years of his life were spent in comparatively poverty and isolation, even as the Esterházy-Frockenstein estates were unequal to the burden of supporting his fabulous extravagance and had to be placed in the hands of curators.

The castle of the house of Frankó, the members of which bear the title of count, was divided into three lines by the sons of Ferencz Esterházy (1641–1683).

The eldest of these, Count Antal (1676–1722), distinguished himself in the war against Rákóczy in 1705, but changed sides in 1704 and commanded the left wing of the Kuruczacs at the engagements of Nagysombat (1704) and Vereskő (1705). In 1706 he defeated the imperial general Guido Stahremberg and penetrated to the walls of Vienna. Still more successful were his operations in the campaign of 1708, when he ravaged Styria, twice invaded Austria, and again threatened Vienna, on which occasion the emperor Joseph narrowly escaped falling into his hands. In 1709 he was routed by the superior forces of General Sigbert Heister at Palota, but brought off the re-

minder of his arms very skilfully. In 1710 he joined Rákóczy in Poland and accompanied him to France and Turkey. He died in exile at Rodosto on the shores of the Black Sea. His son Bálint József [Valentine Joseph], by Anna Maria Nigrelli, entered the French army, and was the founder of the Hallewylly, or French, branch of the family, which became extinct in the male line in 1876 with Count Ladislás.

Four Esterházy’s Campaign Diary (Hung.), ed. by K. Thaly (Pest, 1901).

Count Bálint Miklós [Bálint Joseph] (1740–1805), son of Bálint József, was an enthusiastic partisan of the duc de Choiseul, on whose dismissal, in 1764, he resigned the command of the French regiment of which he was the colonel. It was Esterházy who proposed to Marie Antoinette the portrait of Louis XVI on the occasion of their betrothal, and the close relations he maintained with her after her marriage were more than once the occasion of remonstrance on the part of Maria Theresa, who never seems to have forgotten that he was the grandson of a rebel. At the French court he stood in high favour with the comte d’Artois. He was raised to the rank of maréchal de camp, and made inspector of troops in the French service in 1786. At the outbreak of the French Revolution, he was stationed at Valenciennes, where he contrived for a time to keep his family from the escape of the French émigrés by way of Namur; but, in 1790, he hastened back to Paris to assist the king. At the urgent entreaty of the comte d’Artois in 1791 he quitted Paris for Coblenz, accompanied Artois to Vienna, and was sent to the court of St Petersburg the same year to enlist the sympathies of Catherine II. for the Bourbons. He received an estate from Catherine II., and although the gift was rescinded by Paul I., another was eventually granted him. He died at Grodek in Volhynia on the 23rd of July 1805.

See Mémories, ed. by E. Daudet (Fr.) (Paris, 1905), and Lettres (Paris, 1806).

Two other sons of Count Ferencz (d. 1683), Ferencz and József, founded the houses of Dotis and Csekkós (Landschütze) respectively. Of their descendants, Count Móróczi (1807–1890) of Dotis, Austrian ambassador in Rome until 1856, became in 1861 a member of the ministry formed by Anton Schmerling, and in 1865 joined the clerical cabinet of Richard Belcredi. His bitter hostility to Prussia helped to force the government of Vienna into the war of 1866. His official career closed in 1866, but he remained one of the leaders of the clerical party.

R. N. B.)

Esters, in organic chemistry, compounds formed by the condensation of an alcohol and an acid, with elimination of water; they may also be considered as derivatives of alcohols, in which the hydroxyl hydrogen has been replaced by an acid radical, or as acids in which the hydrogen of the carboxyl group has been replaced by an alkyl or aromatic group. In the case of the polybasic acids, all the hydrogen atoms can be replaced in this way, and the compounds formed are known as “neutral esters.” If, however, some of the hydrogen of the acid remain undisplaced, then “acid esters” result. These acid esters retain some of the characteristic properties of the acids, forming, for example, salts, with basic oxides. Esters may be prepared by heating the silver salt of an acid with an alkyl iodide; by heating the alcohol or alcohols with an acid chloride; by dissolving the anhydrous sodium salt of an acid with a mixture of the alcohol and concentrated sulphuric acid; or by heating for some hours on the water bath, a mixture of an acid and an alcohol, with a small quantity of hydrochloric or sulphuric acids (E. Fischer and A. Speier, Ber., 1866, 28, p. 3352).

The esters of the aliphatic and aromatic acids are colourless neutral liquids, which are generally insoluble in water, but readily dissolve in alcohol and ether. Many possess a fragrant odour and are prepared in large quantities for use as artificial fruit essences. They hydrolyse readily when boiled with solutions of caustic alkalies or mineral acids, yielding the constituent acid and alcohol. When heated with ammonia, they yield acid amides (q.v.). They form unstable addition products with sodium ethylate or methylate. With the Grignard reagent, they
form addition compounds which on the addition of water yield tertiary alcohols, except in the case of ethyl formate, where a secondary alcohol is obtained.

\[
\begin{align*}
R-\text{CO}_2\text{H} + \text{R}^*\text{CO}_2\text{H} \rightarrow R-\text{CO}_2\text{H} + R^*\text{CO}_2\text{H} \\
H-\text{CO}_2\text{H} + H-\text{CO}_2\text{H} \rightarrow H-\text{CO}_2\text{H} + H-\text{CO}_2\text{H}
\end{align*}
\]

N. Menchucktin (Ber., 1892, 15, p. 1445; Ann., 1879, 195, p. 334) estimated the rate of esterification of ethyl alcohol with acetic acid. He found that the normal primary alcohols were all esterified at about the same rate, the secondary alcohols more slowly than the primary, and the tertiary alcohols very slowly. The same general result was also obtained that the nature of the acid used affected the result, for in an homologous series of acids it was found that the rate of esterification became greater as the number of carbon atoms increased, and this result was supported by careful experiments on the esterification of ethyl alcohol with an alcohol as a "reversible" or "balanced" action. The work of M. Berthelot and L. Pecan de St. Gilles (Ann. Chim. Phys., 1862 (3), 65, p. 385 et seq.) has shown in the case of the formation of ethyl and methyl esters from alcohol and acetic acid, a point of equilibrium is reached, beyond which the reaction system cannot pass, unless the system be disturbed in some way by the removal of one of the products of the reaction. V. Meyer (J. Chem. Soc., 1894, 77, p. 526) showed that in benzene compounds ortho-substituents exert a great hindering effect on the esterification of alcohols by acetic acid in the presence of hydrochloric acid, this hindering being particularly marked when two substituents are present in the ortho positions to the carbonyl group. In a case such as the ester is best prepared by the action of an alkyl halide on the salt of the acid, and when once prepared, can only be in a very low degree, affected by heating or cooling.

Ethyl formate, H-\text{CO}_2\text{C}_2\text{H}_5, boils at 55°C and has been used in the artificial preparation of rum. Ethyl acetate (acetic ether), H-\text{CO}_2\text{C}_2\text{H}_5, boils at 77°C. Isonicotylacetate, \text{C}_7\text{H}_5\text{NCO}\text{O} \text{H}_2\text{C}_2\text{H}_5, boils at 166°C. In addition to an odour of apples. Ethyl butyrate, \text{C}_7\text{H}_5\text{CO}_2\text{C}_2\text{H}_5, boils at 121°C. Ethyl caproate, \text{C}_7\text{H}_{15}\text{CO}_2\text{C}_2\text{H}_5, boils at 196°C. Acids of ethyl acetate are volatile esters that are solvents for the volatile acids in the test mixture. Volatile esters of fatty acids under atmospheric pressure, are decomposed, and yield an olefine and a fatty acid.

Ethyl esters of the mineral acids are also known and may be prepared by the ordinary methods as given above. The neutral esters as are a rule insoluble in water and distil unchanged; on the other hand, the carboxylic esters, where the esterifying acid is volatile, are non-volatile and form salt with bases. Ethyl hydroxy sulphate (sulphonic acid), \text{C}_2\text{H}_5\text{SO}_3\text{H}, is obtained by the action of concentrated sulphuric acid on alcohol. The ester is separated from the solution by means of its barium salt, and the salt decomposed by the addition of the calculated amount of sulphuric acid. It is a colourless oil of strongly acid reaction; its aqueous solution decomposes on standing into ethyl alcohol, carbon dioxide, and sulphuric acid. Dimethyl sulphate, (CH_3)_2SO_3H, is a colourless liquid which boils at 187-188°C, with partial decomposition. It is used as a methylating agent (F. Ullmann). Great care should be taken in using dimethyl and diethyl sulphates, as the respiratory organs are affected by the vapours, leading to severe attacks of pneumonia. Ethyl nitrate, \text{C}_2\text{H}_5\text{ONO}_2, is a colourless liquid which boils at 86-3°C. It is prepared by addition of nitric acid to ethyl alcohol, and finally the product obtained by distilling a mixture of alcohol, sulphuric and nitric acids and copper turnings is used in medicine under the name of Stoddart spirits of nitre. Ethyl nitrate, \text{C}_2\text{H}_5\text{ONO}_2, is used in the preparation of the anhydrous diazotisation salts (E. Knoevenagel, Ber., 1890, 23, p. 2094). It is also used in medicine.

ESTHER. The Book of Esther, in the Bible, relates how a Jewish maiden, Esther, cousin and foster-daughter of Mordecai, was made queen by the Persian king Ahasuerus (Xerxes) after he had divorced Vashti; next, how Esther and Mordecai founded the ruin of Haman, the grand-vizier, fell, and Mordecai succeeded him; how Esther obtained the king's permission for the Jews to destroy all who might attack them on the day which Haman had appointed for their destruction; and lastly, how the feast of Purim (Lots ?) was instituted to commemorate their deliverance. Frequent incidental references are made to Persian court-usages (explanations are given in i. 13, viii. 8), while on the other hand the religious rites of the Jews (except fasting), and even Jerusalem and the temple, and the name of Israel, are studiously ignored. Even the name of God is not once mentioned, perhaps from a dread of its profanation during the Satinamia of Purim. The early popularity of the book is shown by the interpolated passages in the Septuagint and the Old Latin versions.

The criticism of Esther began in the 18th century. As soon as the questioning spirit arose, the strangeness of many statements in the book leaped into view. A moderate scholar of our day can find no historical nucleus, and calls it a sort of historical romance. The very first verses in the book startle the reader by their exaggerations, e.g. a banquet lasting 180 days, "127 provinces." Farther on, the improbabilities of the plot are noticeable. Esther, on her elevation, keeps her Jewish origin secret (ii. 10; cf. vii. 3 ff.), although she has been taken from the house of her uncle, who is known to be a Jew (iii. 4; cf. vii. 13), and has remained in constant intercourse with him (ii. 11, 19, 20, 22; cf. iv. 4-17). We are further told that the grand-vizier was an Agagite or Amalekite (iii. 1, &c.); would the nobility of Persia have tolerated this? Or did Haman too keep his non-Persian origin secret? Also that Mordecai offered a gross affront to Haman, for which no slighter punishment would satisfy Haman than the destruction of the whole Jewish race eaten (x. 2-6). Of this savage design eleven months' notice is given (xii. 12-14); and when the danger has been averted by the cleverness of Esther, the provincial Jews are allowed to butcher 75,000, and those in the capital 800 of their Persian fellow-subjects (ix. 6-16).

It is urged, on the other hand, that the assembly mentioned in i. 3 may be that referred to by Herodotus (vii. 8) as having preceded the expedition against Greece. This hypothesis, however, requires us to suppose that Xerxes had returned to Sardis by the tenth month of the seventh year of his reign, which is barely credible. In the reckoning of 127 provinces (cf. Dan. vi. 1; 1 Esd. iii. 2) satrapies and sub-satrapies may be confounded. It is at any rate correct to include India among the provinces; this is justified, not only by Herodotus (i. 94), but by the inscriptions of Darius at Persepolis and Nakhsh-I-Rustam. Herodotus again (vii. 8) confirms the custom referred to in Esth. ii. 12. But what authority can make the conduct of Mordecai credible? To-day the harem is impenetrable, while "any one declining to stand as the grand-vizier passes is almost beaten to death." This, surely, is what a real Mordecai would have suffered from a real Haman. Even the capricious Xerxes would never have permitted the entire destruction of one of the races of the empire, nor would a vizier have proposed it.

Serious difficulties of another kind remain. Mordecai is represented as a fellow-citizen of Jeconiah (597 B.C.), and grand-vizier of Xerxes' twelfth year (474 B.C.). This is parallel to the strange statement in Tobit xiv. 15. And how can we find room for Esther as queen by the side of Amestriz (Herod. vii. 14, ix. 112)? How, too, can a Jewess have been a legal queen (see Herod. iii. 84)? Then take the supposed Persian propernames. "Ahasuerus" may no doubt stand, but very few of the rest (see Nöcker, Ency. Bibl. col. 1402). As to the style, the general verdict is that it points to a late date (see Driver, Introd. p. 484). All together, critics decline to date the book earlier than the 3rd or even 2nd century B.C.

So far we have only been carrying on 18th-century criticism. In more recent years, however, new lines of inquiry have been opened up. First of all by the great Semitic scholar Lagarde. His thesis (seldom defended now) was that Purim corresponds to Fürgadin, the name of the old Persian New Year's and All Souls' festival held in spring, on which the Persians were wont to exhume the graves of their deceased (cf. Esth. ix. 10). In 1801 came a new explanation of Esther from Zimmermann. It is true that in its earlier form his theory was very incomplete. But in justice to this scholar we may notice that from the first he looked for light to Babylonia, and that many other critics now take up the same

1 Kautzsch, Old Testament Literature (1888), p. 130.
2 So Morier, the English minister to the Persian court, quoted by Dean Stanley.
position. There is also another new point which has to be mentioned, viz. that, judging from our experience elsewhere, the Book of Esther has probably passed through various stages of development. Here, then, are two points which call for investigation, viz. (1) a possible mythological element in Esther, and (2) possible stages of development prior to that represented by the Hebrew text.

As to the first point. The Second Targum (on Esth. ii. 7) long ago declared that Esther was so called "because she was like the planet Venus." Recent scholars have expressed the same idea more critically. Esther is a modification of Ishtar, the name of the Babylonian goddess of fertility and of the planet Venus, whose myth must have been partially known to the Israelites even in pre-exilic times, and after the fall of the state must have acquired a still stronger hold on Jewish exiles. A general knowledge of the myth of Marduk among the Israelites cannot indeed be proved. Singularly enough, the Babylonian colonists in the cities of Samaria are said to have made idols, not of Marduk, but of a deity called Succoth-benoth 1 (2 Kings xvii. 30). Nor does the Second Targum help us here; it gives a wild explanation of Mordecai as "pure myrrh." Still it is plain that the name of the god Marduk (Merodach) was known to the Jews, and the Cosmogony in Gen. i. is considered by critics to have ultimately arisen out of the myth of Marduk's conflict with the dragon (see Cosmogony). At any rate the name Mordecai (the vocalization is uncertain) looks very much like Marduk, which, with terminations added, often occurs in cuneiform documents as a personal name. 2 Add to this, that, according to Jensen, Ishtar in mythology was the cousin of Marduk, just as the legend represents Esther as the cousin of Mordecai. 3 The same scholar also accounts for Esther's other name Hadassah (Esth. ii. 7); hadassahu in Babylonian means "bride," which may have been a title of Ishtar.

But we cannot stop short here. Unless the mythological key can also explain Haman and Vashti, it is of no use. Jensen, now followed by Zimmern, is equal to the occasion. Haman, he says, is a corruption of Hamman or Humman or Uman, the name of the chief deity of the Elamites, in whose capital (Susa) the scene of the narrative is laid, while Vashti is Mashi (or Vashti), probably the name of an Elamite goddess.

Following the real or fancied light of these names, Prof. Jensen holds that the Esther-legend is based on a mythological account of the victory of the Babylonian deities over those of Elam, which in plain prose means the deliverance of ancient Babylon from its Elamite oppressors, and that such an account was closely connected with the Babylonian New Year's festival, called Zagmuk, just as the Esther-legend is connected with the festival of Purim.

We are bound, however, to mention some critical objections.

(1) The Babylonian festival corresponding to Purim was not the spring festival of Zagmuk, but the summer festival of Ishtar, which is probably the Sacaea of Berosus, an orgiastic festival analogous to Purim. (2) According to Jensen's theory, Mordecai, and not Esther, ought to be the direct cause of Haman's ruin.

(3) No such Babylonian account as Jensen postulates can be indicated. (4) The identifications of names are hazardous. Fancy a descendant of Kish called Marduk, and an "Agapite" called Humman (where Mordecai [ Ezra ii. 25, Neh. vii. 7] occurs among names which are certainly not Persian [Rigvai is no exception], and Haman [ Tobit xiv. 10] appears as a nephew of Achiachar, which is not a Persian name. Esther, moreover, ought to be parallel to Judith; fancy likening the representative of Israel to the goddess Ishtar!

Next, as to the preliminary literary phases of Esther. Such phases are probable, considering the later phases represented in the Septuagint. There may have once existed in Hebrew a story of the deadly feud between Mordecai (if that be the original

2 ibid., p. 36.
4 So too Zimmern, in Gunkel's Schöpfung und Chaos, p. 313, note 2, name) and Haman, with elements suggested by the story of the battle between the Supreme God and the dragon (see Cosmogony). As the legend stands, Mordecai and Esther seem to be in each other's way. In a passage (i. 15 in LXX.) only found in the Septuagint, but which may have belonged to the original Esther, reference is made to a dream of Mordecai respecting two great dragons, i.e. Mordecai and Haman (x. 7). This is a dream which, however, has not yet been an Esther-legend, which was afterwards worked up with that of Mordecai. This is, in fact, the view of Erbt. Winckler takes a different line. Linguistic facts and certain points of the contents seem to him to show that our Esther is a work of the age of the Seleucidae; more precisely he thinks of the time of the revolt of Molon under Antiochus III. Of course there was a Book of Esther before this, and even in its redacted form our Esther reflects the period of three Persian kings viz. Cyrus, Cambyses and Darius. Lastly, Cheyne (Encyc. Bib. "Purim," § 7), while agreeing with Winckler that the book is based on an earlier narrative, holds that that earlier text differed more widely from the present in its geographical and historical setting than Winckler seems to suppose. The problem of the origin of the name Purim, however, can hardly be said to have received a final solution.

5 Additions to Book of Esther. These "additions" were written originally in Greek and subsequently interpolated in the Greek translation of the Book of Esther. Here the principle of interpolation has reached its maximum. Of 270 verses, 107 are not to be found in the Hebrew text. These additions are distributed throughout the book in the Greek, but in the Latin version, they were relegated to the end of the book by Jerome—an action that has rendered them meaningless. In the Greek they add the form with the canonical text a consecutive history. They were made probably in the time of the Maccabees, and their aim was to supply the religious element which is so completely lacking in the canonical work. The first, which gives the dream of Mordecai and the events which led to his advancement at the court of Artaxerxes, precedes chap. i. of the canonical book. The second and third, which follow, are furnished copies of the letters of Artaxerxes referred to in these verses; the third and fourth, which are inserted after chap. iv., consist of the prayers of Mordecai and Esther, with an account of Esther's approach to the king. The last, which closes the book, tells of the institution of the feast of Purim. The Greek text appears in two widely-differing recensions. The one is supported by the former, and the other—a revision of the first—by codices 19, 53, 408. The latter is believed to have been the work of Lucian. Swete, Old Test. in Greek, ii. 755, has given the former, while Lagarde has published both texts with critical annotations in his Librorum Vetus Testamenti Canonorum, i. 504-541 (1883), and Scholz in his Kommentar über das Buch Esther (1892).

For an account of the Latin and Syriac versions, the Targums, and the other rabbinical literature which follows, see questions relating to these additions, see Frischke, Exeg. Handbuch zu den Apok. (1891), i. 67-108; Schürer, ii. 330-332; Fuller in Speaker's Apocr. i. 360-402; Ryslov in Kautzsch's Apok. u. Pseu. i. 193-212; Siegfried in Jewish Encom. v. 237 seq.; Swete, Introd. to the Old Test. in Greek, 257 seq.; L. B. Paton, A Text-Critical Apparatus to the Book of Esther in O.T. and Semitic Studies in Memory of W. E. Harper (Chicago, 1908).

ESTHONIA (Ger. Estland and Estland, Estonian Eesti-
maa and Meie-maa, also Viroma and Rakwoma; Lettish Izgaum Senna), a Baltic province of Russia, stretching along the south coast of the Gulf of Finland, and having Lake Peipus and Livonia on the S. and the government of St. Petersburg on the E. An archipelago of islands, of which Dagö is the largest, belongs to this government (Osel belongs to Livonia). The area is 7818 sq. m., 503 sq. m. of this being insan. The surface is low,
not exceeding 100 ft. in altitude along the coast and alongside Lake Peipus, while in the interior the average elevation ranges from 200 to 300 ft., and nowhere exceeds 450 ft. It was entirely covered with the bottom moraine of the great ice-sheet of the Glacial Period (20,000 B.C.) and by Löwe (1900). Other collections of In places sands and clays overlie the glacial deposits. The principal stream is the Narova, which issues from Lake Peipus, flows along the eastern border, and empties into the Gulf of Finland. The other drainage arteries are all small, but many in number; while lakes and marshes aggregate fully 24% of the total surface. The climate is severe, great cold being experienced in winter, though milder in summer. The annual mean temperature is between 39° and 43° Fahr. In 1878 the nobility, mostly of German descent, owned and farmed 52% of the land; 43% was farmed, but not owned, by the peasants, mostly Esths or Estis, and only 3% was owned by persons outside the ranks of the nobility. Since then one-fourth of the peasantry have been enabled to purchase their holdings, more than half a million acres having passed into their possession. Agriculture is the chief occupation, and it is, on the larger holdings, carried on with greater scientific knowledge than in any other part of Russia. Of the total area about 15% is under cultivation; meadows and grass-lands amount to 41.7%; and forests cover 10%. The principal crops are rye, oats, barley and potatoes, with large quantities of vegetables. Cattle-breeding flourishes, and meat and butter are constantly increasing items of export. The manufactory consists chiefly of distilleries (over 13,500,000 gallons annually), cotton (at Karhholm and the Narova), woodworking, flour, paper and saw mills, iron and machinery works, and match factories. Fishing is active along the coast, especially for anchovies. The province is intersected by a railway running from St Petersburg to Reval, with branches from the latter city westwards to Baltic Port and southwards into Livonia, and from Taps south to Yuryev (Dorpat). The chief seaports are Reval, Baltic Port, Hapsal, Kunda and Dagü. Estonia is divided into four districts, the chief towns of which are Reval (pop. in 1897, 66,292), the capital of the province; Hapsal, a lively watering-place (3238); Weissenstein (2500); and Wensenberg (5560). The population, which consists chiefly of Esths (356,959 in 1897), Russians (18,000), Germans (16,000), Swedes (3800), and some Jews, is growing fairly fast: in 1870 it numbered 323,606, and in 1897 413,747, of whom 210,109 were women and 76,315 lived in towns; in 1906 it was estimated at 451,700. Ninety-six per cent. of the whole belong to the Lutheran Church. Education is, for Russia, relatively low, but the condition of the peasants is not so little improved that they rose in open revolt in 1859. Since 1878, however, a vast change for the better has been effected in their economic position (see above). The determining feature of their recent history has been the attempt made by the Russian government (since 1881) and the Orthodox Greek Church (since 1883) to ruffly and convert the inhabitants of the province, Germans and Esths alike, by enforcing the use of Russian in the schools and by harsh and repressive measures aimed at their native language.

EESTHNIEN (or Esthnen; the French form of the name; anglicized to Stephens, and latinized to Stephanus), a French family of scholars and printers.

The founder of the race was Henri Esthenn (d. 1520), the scion of a noble family of Provence, who came to Paris in 1502, and soon afterwards set up a printing establishment at the top of the rue Saint-Jean de Beaus, on the hill of Saint-Geneviève opposite the law school. He died in 1520, and, his three sons

national songs. These, which bear an unmistakable family likeness to those of the great Finnish epic of the Kalevala, were collected as the Kâlevi Poêg, and edited by Kreutzwald (1857), and translated into German by Reinhalt (1857-1859) and Berta Kluge (1861) and by Löwe (1900). Other collections of

Esthnische Volkslieder have been published by Neuss (1850–1852) and Kreutzwald and Neuss (1854); while Kreutzwald (1860) and Jannsen (1888) have published collections of legends and national tales. The earliest publication in Estonian was a Lutheran catechism in the 16th century. An Estonian translation of the New Testament was printed at Reval in 1715. Between 1812 and 1822 there appeared at Parnau twenty volumes of collections of Estonian folk-songs, including Kerstinar of the estnischen Sprache by Rosenplänter, and from 1840 onwards many valuable papers on Estonian subjects were contributed to the Verhandlungen der gelehrten estnischen Gesellschaft zu Dorpat. F. J. Wiedemann, who laboured indefatigably in the registration and preservation of matters connected with Estonian language and lore, published an Estnisch-deutsches Wörterbuch (1865; 2nd ed. by Hury, 1891, &c.), and in 1903 there appeared at Reval a Deutsch-estnisches Wörterbuch, by Ploompon and Kalm.
ESTIENNE FAMILY

being minors, the business was carried on by his foreman Simon de Colines, who in 1521 married his widow.

ROBERT ESTIENNE (1503-1559) was Henri's second son. After his father's death he acted as assistant to his stepfather, and in this capacity superintended the printing of a Latin edition of the New Testament in 1610 (1523). Some slight alterations which he had introduced into the text brought upon him the censures of the faculty of theology. It was the first of a long series of disputes between him and that body. It appears that he had intimate relations with the new Evangelical preachers almost from the beginning of the movement, and that soon after this time he definitely joined the Reformed Church.

In 1526 he entered into possession of his father's printing establishment, and adopted as his device the celebrated olive-tree (a reminiscence doubtless of his grandmother's family of Montolve), with the motto from the epistle to the Romans (xi. 20), Noli alium sapere, sometimes with the addition sed time. In 1528 he married Perrette, a daughter of the scholar and printer Josse Bade (Jodocus Badius), and in the same year he published his first Latin Bible, an edition in folio, upon which he had been at work for the last four years. In 1533 appeared his Thesaurus linguae Latinae, a dictionary of Latin words and phrases, upon which for two years he had toiled incessantly, with no other assistance than that of Thiers and Beaufays. A second edition, greatly improved, appeared in 1536, and a further improved, in three volumes, in 1545. Though the Thesaurus is now superseded, its merits must not be forgotten. It was vastly superior to anything of the kind that had appeared before; it formed the basis of future labours, and even as late as 1734 was considered worthy of being re-edited. In 1539 Robert was appointed king's printer for Hebrew and Latin, an office to which, after the death of Conrad Neobar in 1540, he united that of king's printer for Greek. In 1542 he was entrusted by Francis I. with the task of procuring from Claude Garamond, the engraver and type-founder, three sets of Greek type for the royal press. The middle size were the first ready, and with these Robert printed the edition princeps of the Ecclesiasticae Historiae of Eusebius and others (1544). The smallest size were first used for the 1560 edition of the New Testament known as the O mense theolouergum Parisiensium, quibus Biblia a R. Stephano, Typographo Regio, ex usus collumse notariun, eisdem S. R. responsio. A French translation, which is remarkable for the excellence of its style, was published by him in the same year (printed in Robert's hand, and signed "Robertus Estiennae"). Robert proved himself an ardent partisan of Calvin, several of whose works he published. He died there on the 7th of September 1559.

It is by his work in connexion with the Bible, and especially as an editor of the New Testament, that he is on the whole best known. The text of his New Testament of 1550, either in its original form or in such slightly modified form as it assumed in the Elzevir text of 1634, remains to this day the traditional text. But this is due rather to his critical skill than to any critical merit. The readings of the fifteenth MSS., which Robert's son Henri had collected for the purpose were merely introduced into the margin. The text was almost exactly that of Erasmus. It was, however, the first edition ever published with a critical apparatus of any sort. Of the whole Bible Robert printed eleven editions—eight in Latin, two in Hebrew and one in French; while of the New Testament alone he published seven. Five in Latin and two in Greek. The Greek New Testament of 1551 (printed at Geneva) the present division into verses was introduced for the first time. The editions printed from Robert's press were eight in Elzevir, viz. Eusebius, including the Praeparatio evangelica and the De legatione apostolica, and as well as the Historia ecclesiastica already mentioned (1544-1546), Moschopulius (1545), Dionysius of Halicarnassus (Pons Praeter Thraciam, 1543), Justin Martyr (1545), Justinus (1551), Apollinaris (1551), the last being completed, after Robert's departure from Paris, by his brother Charles, and appearing under his name. These editions, all in folio, except the Moschopulius, which is in 4to, are unrivalled for beauty. Robert also printed numerous editions of Latin classics, of which perhaps the best is the Plautus of 1552 with a preface by his friend and co-worker in the cause of humanism.

CHARLES ESTIENNE (1504 or 1505-1564), the third son of Henri, was, like his brother Robert, a man of considerable learning. After the usual humanistic training he studied law at Paris, and took his doctorate degree at the age of 21 as private time tutor to Jean Antoine de Baff, the future poet. In 1551, when Robert Estienne left Paris for Geneva, Charles, who had remained a Catholic took charge of his printing establishment, and in the same year was appointed king's printer. In 1561 he became bankrupt, and is said to have died in a debtor's prison.

His principal works are Prosaidum Rusticum (1554), a collection of tracts which he had compiled from ancient writers on various branches of agriculture, and which continued to be a favourite book down to the end of the 17th century; Dictionarium historicum ac poeticum (1553), the first French encyclopaedia; Thesaurus Ciceronianus (1557), and De dissectione partium corporis humane libri tres, with well-drawn woodcuts (1548). He also published a translation of an Italian comedy, Gli Ingannati, under the title of Le Sacrifice (1545; republished as Les Aveuses, 1549), which had some influence on the development of French comedy; and Paradoxes (1553), an imitation of the Paradosi of Ortenso Landi.

HENRI ESTIENNE (1531-1598), sometimes called Henri II., was the eldest son of Robert. In the preface to his edition of Aulus Gellius (1583), addressed to his son Paul, he gives an interesting account of his father's household, in which, owing to the various nationalities of those who were employed on the press, Latin was used as a common language. Henri thus picked up Latin as a child, but perhaps his own work was his chief effort to learn Greek as a serious study before Latin. At the age of fifteen he became a pupil of Pierre Danès, at that time the first Greek scholar in France. Two years later he began to attend the lectures of Jacques Toussain, one of the royal professors of Greek, and in the same year (1545) was employed by his father to collate a MS. of Dionysius of Halicarnassus. In 1547 he went to Italy, where he spent three years in hunting for and collating MSS. and in intercourse with learned men. In 1550 he visited England, where he was favourably received by Edward VI., and then Flanders, where he learnt Spanish. In 1551 he joined his father at Geneva, which henceforth became his home. In 1554 he gave to the world, as the firstfruits of his researches, two first editions, viz. a tract of Dionysius of Halicarnassus and the so-called "Anacreon." In 1556 he discovered at Rome ten new books (xi.-xx.) of Diodorus Siculus. In 1557 he issued from the press which he had set up at Geneva his three first editions of Herodotus, Dionysius of Tyre, and some fragments of Greek historians, including Appian's "Anabasis," and "Polyb. and an edition of Aeschylus, in which for the first time the Agamemnon was printed in entirety and as a separate play. In 1559 he printed a Latin translation from his own pen of Sextus Empiricus, and an edition of Diodorus Siculus with the new books. His father dying in the same year, he became under his will owner of his press, subject, however, to the condition of keeping it at Geneva. In 1566 he published his best-known French work, the Apologie pour l'Herodo, or, as he himself called it, L'introduction au traité de la conformité des mœurs anciennnes avec les modernes ou Traité préparatif à l'Apologie pour l'Historie. Some passages being considered objectionable by the Geneva consistory, he was compelled to cancel the pages containing them. The book became highly popular, and within sixteen years twelve editions were printed. In 1572 he published the great work upon which he had been labouring for many years, the Thesaurus Histrioeis, in 5 vols. fol. The publication in 1578 of his Deux Dialogues du nouveau françois italienne brought him into a fresh dispute with the consistory. To avoid their censure he went to Paris, and resided at the French court for a year. On his return to Geneva he was summoned before the consistory, and, proving contumacious, was imprisoned for a week. From this time his life became more and more of a nomad. He is to be found...
at Basel, Heidelberg, Vienna, Pest, everywhere but at Geneva, these journeys being undertaken partly in the hope of procuring patrons and purchasers, for the large sums which he had spent on such publications as the Thesaurus and the Plato of 1578 had almost ruined him. His press stood nearly at a standstill. A few editions of classical authors were brought out, but each successive one showed a falling off. Such valuable as it later one, from 1580 to 1589, due to the enterprise and services furnished by Casaubon, who in 1586 had married his daughter Florence. His last years were marked by ever-increasing infirmity of mind and temper.

In 1597 he left Geneva for the last time. After visiting Montpellier, where Casaubon was now professor, he started for Paris, but was seized with sudden illness at Lyons, and died there at the end of January 1598.

Few men have ever served the cause of learning more devotedly. For Casaubon, not only the aspect which he presented, whether as printer, editor or original writer, was enormous. The productions of his press, though printed with the same beautiful type as his father's, were the very essence of the part of the printed which inferior to them in general beauty. The best, perhaps, from a typographical point of view, are the Poliae Graecae principii (folio, 1566), the Plutarch (13 vols. 8 to 12), and the Plato vero (also 1578). It was rather the scholarship which gave value to his editions. He was not only his own press-corrector but his own editor. Though by the latter half of the 16th century nearly all the important Greek and Latin authors that we now possess had been printed, his untried activity still found some gleanings. Eighteen first editions of Greek authors and one of a Latin author are due to his press. The importance of the part he has been able to mention on his side is that his reputation as a scholar and editor has increased of late years. His familiarity with the Greek language has always been admitted to have been quite exceptional; but he has been accused of want of taste, of negligence of correctness and of carelessness in all. The most serious charge that has been passed on his Plutarch, in which he is said to have introduced conjectures of his own into the text, while pretending to have derived them from the MS. authority. But a late edition of Sophocles has shown that, though like all the other editors of his day he did not give references to his authorities, every one of his supposed conjectures can be traced to some reasoning. Whatever may be said as to his taste or his judgment, it seems that he was both careful and scrupulous, and that he only resorted to conjecture when authority failed him. And, whatever the merit of his conjectures, he was at least able to show what conjecture could do towards restoring a hopelessly corrupt passage. The work, however, on which his name as a scholar is most surely based is the Thesaurus Graecae linguae. After making due allowance for the fact that considerable materials for the work had been already collected by his father, and that he received considerable assistance from the German scholar Sylburg, he is entitled to the highest place among the most important of the Greek scholars. On the whole, it was a work of the greatest service to scholarship and which in those early days of Greek learning could have been produced by no one but a giant. Two editions of the Thesaurus appeared, the first published in the century—at London by Valpy (1815-1822) and at Paris by Didot (1831-1863).

It was one of Henri Estienne's great merits that, unlike nearly all the scholars of his day who preceded him, he did not neglect the language. In the Traité de la conformité du langage français avec le Grec (published in 1565, but without date; ed. L. Feugère, 1850), French is asserted to have, among modern languages, the most affinity with Greek, the first of all languages. Deux Dialogues du nouveau françois italiand (Geneva, 1578; ed. P. Ristelhuber, 2 vols., 1586) was directed against the fashion prevailing in the court of Catherine de' Medici of using Italian words and forms in Project du livre intitulé de la Précieuse du langage français (Paris, 1579; ed. E. Huguet, 1865) treats of the superiority of French to Italian. An interesting work of Henri Estienne and Henry III. having expressed some doubt as to the genuineness of some of them, Henri Estienne published, in 1594, Les Promenades ou le 1. livre des Proverbes épigrammatiques (never republished and very rare).

Finally, there remains the Apologie pour Hérodot, his most famous work. The ostensible object of the book is to show that the strange stories which are told by the historian may be parallel to any equally strange stories in modern times. Virtually it is a bitter satire on the writer's age, especially on the Roman Church. Put together without any method, its extreme desultoriness makes it difficult to read continuously, but there are passages of great interest, collected partly from various literary authorities, notably from the preachers Menot and Maillard, partly from the writer's own multifarious experience, with which it is packed, make it an interesting commentary on the manners and fashions of the time. But satire, to be effective, should be either humorous or rightly indignant, and, while such humour as there is in the Apologie is decidedly heavy, the writer's indignation is generally forgotten in the chief merit. Though it bears evident traces of hurry, it is, like that of all Henri Estienne's French writings, clear, easy and vigorous, uniting the directness and sensuousness of the older writers with a suppleness and logical precision which at this time were almost new elements in French prose. An edition of the Apologie has recently been published by Liseux (ed. Ristelhuber, 2 vols., 1879), after one of the two copies of the original uncancelled edition that are known to exist. The remarkable political pamphlet Du discours de la mer et de la terre en detour de la Catherine de Medicis, which appeared in 1574, has been ascribed to Henri Estienne, but the evidence both internal and external is conclusive against the being the author of it. Of his Latin writings, the most noteworthy are De Latinistica false suspecta (1576), the Pseudo-Ciceron (1577) and the Ristoldisidaculis (1578), all three written against the Clementianus, and the Franciscanense Empiricus (1574), a panegyric on the Frankfort fair (reprinted with a French translation by Liseux, 1875). He also wrote a large quantity of indifferent Latin verses, including a long poem entitled Musa magistri Principium (Basel, 1591).

The primary authorities for an account of the Estiennes are their own works. In the garrulous and egotistical prefaces which Henri was in the habit of prefixing to his editions will be found many scattered biographical details. Twenty-seven letters from Henri to John Crato of Cratfield (ed. F. Passow, 1830) have been printed, and there is one of Robert's in Herminjard's Correspondence des Résistans de l'ancien et du nouveau langage (9 vols. published 1866-1897), while a few other contemporary references to him will be found in the same work. The secondary authorities are Janssen and Alkmene, and no one even, if we except his own son, not更重要的; Maittaire, Stephanozartia historiarum (London, 1790); A. A. Renouard, Annales de l'imprimerie des Estiennes (2nd ed., Paris, 1843); the article on Estienne in the Encyclopaedia, New Edition; M. T. Pattison, Essays, 1. 6 fl. (1889); L. Clément, Henri Estienne et son ouvres françaises (Paris, 1899). There is a good account of Henri's Thesaurus in the Quart. Rev. for January 1820, written by Bishop Blomfield.

ESTON, an urban district in the Cleveland parliamentary division of the North Riding of Yorkshire, England, 4 m. S.E. of Middlesbrough, on a branch of the North Eastern railway. Pop. (1901) 11,199. This is one of the principal centres from which the great iron-ore deposits of the district are worked, and there are extensive blast-furnaces, iron-foundries and steam sawing-mills in the district. Immediately W. of Eston lies the urban district of Ormesby (pop. 9482), and the whole district is densely populated (see MIDDLESBROUGH). Marton, west of Ormesby, was the birthplace of Captain Cook (1728). Numerous early earthworks fringe the hills to the south.

ESTOPPEL (from O. Fr. estoper, to stop, bar; estripe, mod. étape, a stage, a stop; etappe, a stage on a road), a rule in the law of evidence by which a party in litigation is prohibited from asserting or denying something, when such assertion or denial would be inconsistent with his own previous statements or conduct. Estoppel is said to arise in three ways—(1) by recour or judgment, (2) by deed, and (3) by matter in pais or conduct. (1) Where a cause of action has been tried and final judgment has been pronounced, the judgment is conclusive—either party is estopped in his own cause should he now try to renew the litigation by a new action. (2) A party is estopped by the judgment. "Every judgment is conclusive proof as against parties and privies, of facts directly in issue in the case, actually decided by the court, and appearing from the judgment itself to be the ground on which it was based."—Stephen's Digest of the Law of Evidence, Art. 41. (2) It is one of the privileges of deeds as distinguished from simple contracts that they operate by way of estoppel. "A man shall always be estopped by his own deed, and not permitted to do anything in contradiction to what he has once so solemnly and deliberately avowed." (Blackstone, 2 Com. 205): e.g. where a bond recited that the defendants were authorized by acts of parliament to borrow money, and that under such authority they had borrowed money from a certain person, they were estopped from setting up as a defence that they did not in fact so borrow money, as stated by their deed. (3) Estoppel by conduct, or, sometimes called, estoppel by matter in pais, is the most important head. "The Dei Dominus, the law says, when a person in his dealings with others has acted so as to induce them to believe a thing to be true and to act on such belief, he may not in any proceeding between himself and them deny the thing to be true; e.g. a partner retiring from a firm without giving notice to the customers, cannot, as against a customer having no knowledge of his retirement, deny that he is a partner.
ESTOUTVILLE—ESTREMADURA

As between landlord and tenant the principle operates to prevent the denial by the tenant of the landlord's title. So if a person comes upon land by the licence of the person in possession, he cannot deny that the licensor had a title to the possession at the time the licence was given. Again, if a man accepts a bill of exchange he may not deny the signature or the capacity of the drawer. So a person receiving goods as bailiff from another cannot deny the title of that other to the goods at the time they were entrusted to him.

Estoppel of whatever kind is subject to one general rule, that it cannot override the law of the land; for example, a corporation would not be estopped as to acts which are ultra vires.

ESTOUTVILLE, GUILLAUME D' (1402-1483), French ecclesiast, was bishop of Angers, of Digne, of Porto and Santa Rufina, of Ostia and Velletri, archbishop of Rouen, prior of Saint Martin des Champs, abbott of Mont St Michel, of St Ouen at Rouen, and of Montaubon. He was sent to France as legate by Pope Nicholas V. to make peace between Charles VII. and England (1451), and undertook, ex officio, the revision of the trial of Joan of Arc; he afterwards reformed the statutes of the university of Paris. He then went to preside over the assembly of clergy which met at Bourges to discuss the observation of the Pragmatic Sanction (see BASEL, COUNCIL OF), finally returning to Rome, where he passed almost all the rest of his life. He was a great builder, Rouen, Mont St Michel, Pontoise and Gaillon owning many noble buildings to his initiative.

ESTOVERS (from the O. Fr. estover, estovir, a verb used as a substantive in the sense of that which is necessary; the word is of disputed origin; it has been referred to the Lat. stoves, to stand, or stovire, to desire), a term, in English law, for the wood which a tenant for life or years may take from the land he holds for repair of his house, the implements of husbandry, and the hedges and fences, and for firewood. The O. Eng. word for estover was bote or boot (literally meaning "good," "profit," the same word as seen in "better"). The various kinds of estovers were thus known as house-bote, cart or plough-bote, hedge or hay-bote, and fire-bote respectively. These rights may, of course, be restricted by express covenants. Copyholders have similar rights over the land they occupy and over the waste of the manor, in which case the rights are known as "Commons of estovers." (See Commons.)

ESTRADA, LA, a town of north-western Spain, in the province of Pontevedra, 15 m. S. E. of Santiago de Compostela. Pop. (1800) 23,916. La Estrada is the chief town of a densely-populated mountainous district; its industries are agriculture, stock-breeding, and the manufacture of linen and woolen clothing. Timber from the mountain forests is conveyed from La Estrada to the river Ulla, 4 m. N., and thence floated down to the seaports on Arose Bay. The nearest railway-station is Requeijos, 7 m. W., on the Pontevedra-Santiago railway. There are mineral springs at La Estrada and at Caldas de Reyes, 11 m. W.S.W.

ESTRADA, a French architectural term for a raised platform (see DATE). In the Levant the estrade of a divan is called Sofia (Blondel), from which comes our "sofa."

ESTRACES, GODFROI, COMTE d' (1607-1686), French diplomatist and marshal, was born at Agen. He was the son of François d’Estrades (d. 1653), a partisan of Henry IV., and brother of Jean d’Estrades, bishop of Compostel. He became a page to Louis XIII., and at the age of nineteen was sent on a mission to Maurice of Holland. In 1646 he was named ambassador extraordinary to Holland, and took part in the conferences at Münster. Sent in 1661 to England, he obtained in 1662 the restitution of Dunkirk. In 1667 he negotiated the treaty of Breda with the king of Denmark, and in 1678 the treaty of Nijmegen, which ended the war with Holland. Independently of these diplomatic missions, he took part in the principal campaigns of Louis XIV., in Italy (1668), in Catalonia (1655), in Holland (1672); and was created marshal of France in 1673. He left Lettres, mémoires et négociations en qualité d'ambassadeur en Hollande depuis 1663 jusqu'en 1688, of which the first edition in 1709 was followed by a nine-volume edition (London (the Hague), 1743).

Of the sons of Godfroi d’Estrades, Jean François d’Estrades was ambassador to Venice and Piedmont; Louis, marquis d’Estrades (d. 1711), succeeded his father as governor of Dunkirk, and was the father of Godfroi, also a marquis and lieutenant-general, who was killed at the siege of Belgrade, 1717.

ESTREAT (O. Fr. estreit, Lat. extractus), originally, a true copy or duplicate of some original writing or record; now used only with reference to the endorsement of a forfeited recognizance. At one time it was the practice to extract and certify into the exchequer copies of entries in court rolls which contained provisions or orders in favour of the treasury, hence the estreiting of a recognizance was the taking out from among the other records of the court in which it was filed and sending it to the exchequer to be enforced, or sending it to the sheriff to be levied by him, and then returned by the clerk of the peace to the lords of the treasury. (See Recognizance.)

ESTRÉES, GABRIELLE D’ (1573-1599), mistress of Henry IV. of France, was the daughter of Antoine d’Estrées, marquis of Crevoux, and Françoise Babou de la Bourdaisière. Henry IV., who in November 1590 stayed at the castle of Crevoux, became enamoured of her. Her father, Louis d’Estrées, count of Chantefort (d. 1597) and Étampes (1598), a peeress of France. The king even proposed to marry her in the event of the success of his suit for the nullification by the Holy See of his marriage with Margaret of Valois; but before the question was settled Gabrielle died, on the 10th of April 1599. Poison was of course suspected; but her death was really caused by queruel convulsions (clemencea).

ESTREMADURA, or Extremadura, an ancient territorial division of central and western Portugal, and of western Spain; comprising the modern districts of Leiria, Santarem and Lisbon, in Portugal, and the modern provinces of Badajos and Cáceres in Spain. (See Extremadura, 2nd Ed., 1879.) The name of Extremadura appears to be of early Romance or Late Latin origin, and probably was applied to all the far western lands (extrema ora) bordering upon the lower Tagus, as far as the Atlantic Ocean. It is thus equivalent to Land's End, or Finisterre. In popular speech it is more commonly used than the names of the modern divisions mentioned above, which were created in the 19th century. As, however, there are many racial, economic and historic differences between Portuguese and Spanish Extremadura, the two provinces are separately described below.

1. Portuguese Extremadura is bounded on the N. by Beira, E. and S. by Alentejo, and W. by the Atlantic Ocean. Pop. (1900) 1,212,418; area, 6637 sq. m. The greatest length of the province, from N. to S., is 165 m.; its greatest breadth, from E. to W., is 72 m. The general uniformity of the coast-line is broken by the broad and deep estuaries of the Tagus and the Sado, and by the four conspicuous promontories of Cape Carvoeiro, Cape da Roca, Cape Espichel and Cape de Sines. The Tagus is the great navigable waterway of Portuguese Extremadura, flowing from north-east to south-west, and fed by many minor tributaries, notably the Zézere on the right and the Zatas on the left. It divides the country into two nearly equal portions, wholly dissimilar in surface and character. South of the Tagus the land is almost everywhere low, flat and monotonous, while in several places it is rendered unhealthy by undrained marshes. The
ESTREMADURO—ESTUARY

Sado, which issues into Setubal Bay, is the only important river of this region. North of the Tagus, and parallel with its right bank, extends the mountain chain which is known at its northern extremity as the Serra do Aire and, where it terminates above Cape da Roca, as the Serra da Cinta. This ridge, which is buttressed on all sides by lesser groups of hills, and includes part of the famous lines of Torres Vedras (q.v.), exceeds 2200 ft. in height, and constitutes the watershed between the right-hand tributaries of the Tagus and the Liz, Sizandro and other small rivers which flow into the Atlantic. On its seaward side, except for the line of sheer and lofty cliffs between Cape Carvoeiro and Cape da Roca, the country is mostly flat and sandy, with extensive heaths and pine forests; but along the fertile and well-cultivated right bank of the Tagus the river scenery, with its terraced hills of vines, olives and fruit trees, often resembles that of the Rhine in Germany. The natural resources of Portuguese Estremadura, with its inhabitants, industries, commerce, communications, &c., are described under Portugal; for on such matters there is little to be said of this central and most characteristic province which does not apply to the whole kingdom. Separate articles are also devoted to Lisbon, the capital, and Abrantes, Cinta, Leiria, Mafra, Santarem, Setubal, Tomar, Viseu and Torres Vedras, the other lesser towns and cities. The women of Peniche, a small fishing village on the promontory of Cape Carvoeiro, have long been celebrated throughout Portugal for their skill in the manufacture of fine lace.

2. Spanish Estremadura is bounded on the N. by Leon and Old Castile, E. by New Castile, S. by Andalusia, and W. by the Portuguese province of Beira and Alemtejo, which separate it from Portuguese Estremadura. Pop. (1900) 882,410; area, 16,118 sq. m. Spanish Estremadura consists of a tableland separated from Leon and Old Castile by the lofty Sierra of Gredos, the plateau of Bejar and the Sierra de Gata, which form an almost continuous barrier along the northern frontier, with its summits ranging from 6000 to more than 8500 ft. in altitude. On the south the comparatively low range of the Sierra Morena constitutes the frontier of Andalusia; on the east and west there is a still more gradual transition to the plateau of New Castile and the central plains of Portugal. The tableland of Spanish Estremadura is itself bisected from east to west by a line of mountains, the Sierras of San Pedro, Montanchez and Guadalupe (4000-6000 ft.), which separate its northern half, drained by the river Tagus, from its southern half, drained by the Guadiana. These two halves are respectively known as Alta or Upper Estremadura (the modern Cáceres), and Baja or Lower Estremadura (the modern Badajoz). The Tagus and Guadiana flow from east to west through a monotonous country, level or slightly sloping, and covered with a thin growth of shrubs and grass. Perhaps the most characteristic feature of this tableland is the vast heaths of gum-cistus, which in spring colour the whole landscape with leagues of yellow blossom, and in summer change to a brown and arid wilderness.

The climate in summer is hot but not unhealthy, except in the swamps which occur along the Guadiana. The rainfall is scanty; dew, however, is abundant and the nights are cool. Although the high mountains are covered with snow in November, the winters are not usually severe. The soil is naturally fertile, but drought, floods and locusts render agriculture difficult, and sheep-farming is the most important of Estremaduran industries. (See Spain: Agriculture.) In the 19th century, however, this industry lost much of its former importance owing to foreign competition.

Immense herds of swine are bred and constitute a great source of wealth to the inhabitants, not only supplying them with food, but also forming a great article of export to other provinces—the pork, bacon and hams being in high esteem. The beech, oak and chestnut woods afford an abundance of food for swine, and there are numerous plantations of olive, cork and fruit trees, but a far greater area of forest has been destroyed. For an account of commerce, mining, communications, &c., in Spanish Estremadura, with a list of the chief towns, see CáCERES and BADAJOS. In character and physical type, the people of this region are less easily classified than those of other Spanish provinces. They lack the endurance and energy of the Galicians, the independence and enterprising spirit of the Asturians, Basques and Catalans, the culture of the Castilians and Andaluscians. Their failure to develop a distinctive and a type of their own and their civilization is perhaps due to the adverse economic history of their country. The two great waterways which form the natural outlet for Estremaduran commerce flow to the Atlantic through a foreign and, for centuries, a hostile territory. Like other parts of Spain, Estremadura suffered severely from the expulsion of the Jews and Moors (1492-1610), while the compensating treasure, derived during the same period from Spanish America, never reached a province so remote at once from the sea and from the chief centres of national life. Although Cortes (1485-1547), the conqueror of Mexico and Peru, were both born in Estremadura, their exploits, far from bringing prosperity to their native province, only encouraged the emigration of its best inhabitants. Heavy taxation and harsh land-laws prevented any recovery, while the felling of the forests reduced many fertile areas to waste land, and rendered worse a climate already unfavourable to agriculture. Few of these evils have left upon the mind of the traveller a deeper impression of hopeless poverty.

ESTREMADO, a town of Portugal, in the district of Evora, formerly included in the province of Alemtejo; 104 m. by rail E. of Lisbon, on the Branca-Evora-Elvas railway. Pop. (1900) 7920. Estremoz is built at the base of a hill crowned by a large dismantled citadel; its fortifications, which in the 17th century accommodated 20,000 troops and rendered the town one of the principal defences of the frontier, are now obsolete. There are marble quarries in the neighbourhood, and the Estremoz bichas, red earthenware jars, are used throughout Portugal as water-holders and exported to Spain. At Ameixial (1188) and Montes Claros, near Estremoz, the Spanish were severely defeated by the Portuguese in 1663 and 1665. Villa Vicosa (3841), 10 m. S.E., is a town of pre-Roman origin, containing a royal palace. The altars with Latin inscriptions to the Iberian god Endo-vellicus, found at Villa Vicosa, are preserved in the museum of the Royal Academy of Sciences, Lisbon.

ESTUARY (from the Lat. aestuarium, a place reached by aetas, the tide), an arm of the sea narrowing inwards at the mouth of a river where sea and fresh water meet and are mixed, i.e. the tidal portion of a river's mouth. Structurally the estuary may represent the long-continued action of river erosion and tidal erosion confined to a narrow channel, most effective where most concentrated, or an estuary may be the drowned portion of a former bay. In times of high water and along coast-belt it will be observed that under the Severn estuary the sea deepens in a number of steps descending by concentric V's that become blunter towards deep water until the last is a mere indentation pointing towards the long narrow termination of the present estuary. In this and in similar cases the progress of the estuary is indicated upon what is now the continental shelf. The chief interest in estuarine conditions is the mingling of sea and fresh water. Where, as in the Severn and the Thames, the fresh water meets the sea gradually the water is mixed and there is very little change in salinity at high tide. The fresh water flows over the salt water and there is a continuous rapid change in salinity towards the sea, for the currents sweeping in and out mix the water constantly. Where the river brings down a great quantity of fresh water in a narrow channel, the change of salinity at high and low water is very marked. "When, however, the inlet is very large compared with the river, and there is no marked change in depth, the character is one of rapid change in the upper end. In the Firth of Forth, for example, the landward half is an estuary, but in the seaward half the water has become more thoroughly mixed, the salinity is almost uniform from surface to bottom, and increases very gradually towards the sea. The river-water meets the sea diffused uniformly through a deep mass of water scarcely fresher than the sea itself, so that the two mix uniformly, and the sea becomes slightly freshened.
throughout its whole depth for many miles from land” (H. R. Mill, *Realm of Nature*, 1807).

**ESZTERGOM** (Ger. *Gran*; Lat. *Strigium*), a town of Hungary, capital of the county of the same name, 36 m. N.W. of Budapest by rail. Pop. (1900) 16,948, mostly Magyars and Roman Catholics. It is situated on the right bank of the Danube, nearly opposite the confluence of the Gran, and is divided into the town proper and the suburb, Lóuburbe. The town is the residence of the prince of Esztergom, and its cathedral, built in 1811–1870, after the model of St Peter’s at Rome, is one of the finest and largest in the country. It is picturesquely built on an elevated and commanding position, 215 ft. above the Danube, and its dome, visible from a long distance, is 260 ft. high, and has a diameter of 52 ft. The interior is very richly decorated, notably with fine frescoes, and its treasury and fine library of over 60,000 volumes are famous. Besides several other churches and two monastic houses, the principal buildings include the handsome palace of the primate, erected in 1883; the archiepiscopal library, with valuable incunabula and old MSS.; the seminary for the education of Roman Catholic priests; the residences of the chapter; and the town-hall. The population is chiefly employed in cloth-weaving, wine-making and agricultural pursuits. An iron bridge, 164 ft. long, connects Esztergom with the market town of Pártkány (pop. 2836) on the opposite bank of the Danube. Esztergom is one of the oldest towns of Hungary, and is famous as the birthplace of St Stephen, the first prince crowned “apostolic king” of Hungary. During the early times of the Hungarian monarchy it was the most important mercantile centre in the country, and it was the meeting-place of the diets of 1016, 1111, 1114 and 1126. It was almost completely destroyed by Tatar hordes in 1241, but was rebuilt and fortified by King Béla IV. In 1543 it fell into the hands of the Turks, from whom it was recovered, in 1606, by Karol Mansfeld. In 1604 it reverted to the Turks, who held it until 1683, when it was regained by the united forces of John Sobieski, king of Poland, and Prince Charles of Lorraine. It was created an archbishopric in 1001. During the Turkish occupation of the town the archbishopric was removed to Tyrnau, while the archbishop himself had his residence in Pressburg. Both returned to Esztergom in 1850. In 1768 it was declared a free city by Joseph I. On the 15th of April 1818 it was partly destroyed by fire.

For numerous authorities on the see and cathedral of Esztergom see V. Chevalier, *Répertoire des sources*. Topo-bibliogr. v. v. “Gran.” Of these may be mentioned especially F. Krausz, *Monumenta Ecclesiae Stirpium Hungariae*, in *Danks*, Geschichtliches ..., *aus dem Grazer Dom Sachs* (Gran, 1886).

**ÉTAGE,* a piece of light furniture very similar to the English what-not, which was extensively made in France during the latter part of the 18th century. As the name implies, it consists of a series of stages or shelves for the reception of ornaments or books, etc., and is designed to take the place of the commode. It was very often corner-wise in shape, and the best Louis XVI. examples in exotic woods are exceedingly graceful and elegant.

**ÉTAH,** a town and district of British India, in the Agra division of the United Provinces. The town is situated on the Grand Trunk road. Pop. (1901) 8796. The district has an area of 1737 sq. m. The district consists for the most part of an elevated alluvial plateau, dipping down on its eastern slope into the valley of the Ganges. The uplands are irrigated by the Ganges canal. Between the modern bed of the Ganges and its ancient channel lies a belt of fertile land, covered with a rich deposit of silt, and abundantly supplied with natural moisture. A long line of swamps and hollows still marks the former course of the river; and above it rises abruptly the original cliff which now forms the terrace of the upland plain. The Kali Nadi, a small stream flowing in a deep and narrow gorge, passes through the centre of the district, and affords an outlet for the surface drainage. Etah was at an early date the seat of a primitive Aryan civilization, and the surrounding country is mentioned by Hsian Tsang, the Chinese Buddhist pilgrim of the 7th century A.D., as rich in temples and monasteries. But after the bloody repression of Buddhism before the 8th century, the district seems to have fallen once more into the hands of aboriginal tribes, from whom it was wrested a second time by Rajputs during the course of their great migration eastward. With the rest of upper India it passed under the sway of Mahmid of Ghazni in 1017, and thenceforth followed the fortunes of the Mahomedan empire. At the end of the 18th century it formed part of the territory over which the wazir of Oudh had made himself ruler, and it came into the possession of the British government in 1803, under the treaty of Lucknow. During the mutiny of 1857 it was the scene of serious disturbances, coupled with the usual anarchic quarrels among the native princes. In 1901 the population was 865,946, showing an increase of 25% in the decade due to the extension of canal irrigation. It is traversed by a branch of the Rajputana railway from Agra to Cawnpore, with stations at Kasganj and Soron, which are the two largest towns. It has several printing presses, indigo factories, and factories for pressing cotton, and there is a considerable agricultural export trade.

**ÉTAMPS,** *Anne de Pisseleu d’Heilly, Duchess* (1508–1580), mistress of Francis I. of France, daughter of Guillaume de Pisseleu, sieur d’Heilly, a nobleman of Picardy. She came to court before 1522, and was one of the maids of honour of Louise de Savoy. Francis I. made her his mistress, probably on his return from his captivity at Madrid (1526), and soon gave up Madame de Chateaubriant for her. Anne was considered pretty, witty and educated, and was lavished with the favour of the king till the end of the reign (1547). The liaison received some official recognition; when Queen Eleanor entered Paris (1530), the king and Anne occupied the same window. In 1533 Francis gave her in marriage to Jean de Brosse, whom he created duc d’Étampes. The influence of the duchesse d’Étampes, especially in the last years of the reign, was considerable. She upheld Admiral Chabot against the constable de Montmorency, who was supported by her rival Diane de Poitiers, the dauphin’s mistress. She was a friend to new ideas, and co-operated with the king’s sister, Marguerite d’Angoulême. She used her influence to elevate and enrich her family, her uncle, Antoine Sanguin (d. 1559), being made bishop of Orleans in 1535 and a cardinal in 1539. The accusations made against her of having allowed herself to be won over by the emperor Charles V. and of playing the traitor in 1544 rest on no serious proof. After the death of Francis I. (1547) she was dismissed from the court by Diane de Poitiers, humiliated in every way, and died in obscurity much later, probably in the reign of Henry III.

**ÉTAMPS,** a town of northern France, capital of an arrondissement in the department of Seine-et-Oise, on the Orléans railway, 35 m. S. by W. of Paris. Pop. (1906) 8790. Étampes is a long straggling town hemmed in between the railway on the north and the Chalouette on the south; the latter is a tributary of the Juine which waters the eastern outskirts of the town. A fine view of Étampes is obtained from the Tour Guinette, a ruined keep built by Louis VI. in the 12th century on an eminence on the other side of the railway. Notre-Dame du Fort, the chief church, dates from the 12th and 13th centuries; irregular in plan, it is remarkable for a fine Romanesque tower and spire, and for the crenellated wall which partly surrounds it. The church contains ancient paintings and other artistic works. St Barbe (12th and 16th century), which preserves a Romanesque doorway, and St Martin (12th and 13th centuries), with a leaning tower of the 16th century, are of less importance. The civil buildings offer little interest, but two houses named after Anne de Pisseleu (see above), mistress of Francis I., and Diane de Poitiers, mistress of Henry II., are graceful examples of Renaissance architecture. In the square there is a statue of the naturalist, Geoffroy Saint-Hilaire, who was born in Étampes. The magnificent, a tribunal and cultured, and a communal college are among the public institutions of Étampes. Flour-milling,

1 The château of Meudon, belonging to the Sanguin family, was handed over to the duchesse d’Étampes in 1539, Sanguin was translated to Limoges in 1546, and became archbishop of Toulouse in 1550.
metal-founding, leather-dressing, printing and the manufacture of boots and shoes and hosiery are carried on; there are quarries of paving-stone, nurseries and market gardens in the vicinity, and the town has important markets for cereals and sheep.

Étampes (Lat. Stampa) existed at the beginning of the 7th century and in the early middle ages belonged to the crown domain. During the middle ages it was the scene of several councils, the most notable of which took place in 1130 and resulted in the recognition of Innocent II as the legitimate pope. In 1052, during the war of the Fronde it suffered severely at the hands of the royal troops under Turenne.

Lords, Counts and Dukes of Étampes.—The lordship of Étampes, in what is now the department of Seine et Oise in France, belonged to the royal domain, but was detached from it on several occasions in favour of princes, or kings' favourites. St Louis gave it to his mother Blanche of Castile, and then to his wife Marguerite of Provence. Louis, the brother of Philip the Fair, became lord of Étampes in 1317 and count in 1327; he was succeeded by his son and his grandson. Francis I. raised the countship of Étampes to the rank of a duchy for his mistress Anne de Pisseleu D'Heilly. The new duchy passed to Diane de Poitiers (1553), to Catherine of Lorraine, duchess of Montpensier (1578), to Marguerite de Valois (1582) and to Gabrielle d'Estrees (1598). The latter transmitted it to her son, Cesar de Vendome, and his descendants held it till 1712. It then passed by inheritance to the families of Bourbon-Conti and of Orleans.

Étapes, a town of northern France, in the department of Seine-et-Oise, 20 m. by rail and 16 by road from Paris. This town, situated on the right bank of the estuary of the Canche, 3 m. from the Straits of Dover, 17 m. S. of Boulogne by rail. Pop. (1900) 3166. Étapes has a small fishing and commercial port which enjoyed a certain importance during the middle ages. Boat-building is carried on. There is an old church with a statue of the Virgin much revered by the sailors. The Canche is crossed by a bridge over 1600 ft. in length. Le Touquet, in the midst of pine woods, and the neighboring watering-place of Paris-Plage, 33 m. W. of Étapes at the mouth of the estuary, are much frequented by English and French visitors for golf, tennis and bathing, and Étapes itself is a centre for artists. Antiquarian discoveries in the vicinity of Étapes have led to the conjecture that it occupies the site of the Gallo-Roman port of Quentovicus. In 1492 a treaty was signed here between Henry VIII., king of England, and Charles VIII., king of France.

Etawah, a town and district of British India, in the Agra division of the United Provinces. The town is situated on the left bank of the Jumna, and has a station on the East Indian railway, 206 m. from Allahabad. Pop. (1901) 42,570. Deep fissures intersect the various quarters of the town, over which broad roads connect the higher portions by bridges and embankments. The Jama Masjid (Great Mosque) is the chief architectural ornament of Etawah. It was originally a Hindu temple, and was adapted to its present use by the Mahomedan conquerors. Several fine Hindu temples also stand about the mound on which are the ruins of the ancient fort. Etawah is now only the civil headquarters of the district, the military cantonment having been abandoned in 1861. Considerable trade is carried on by rail and river. The manufactures include cotton cloth, silk, jaggery, and turmeric.

The District of Etawah has an area of 1691 sq. m. It forms a purely artificial administrative division, stretching across the level plain of the Doab, and beyond the valley of the Jumna, to the gorges of the Chambal, and the last rocky outliers of the Vindhyan range. The district exhibits a striking variety of surface and scenery. The greater portion lies within the Doab or level alluvial plain between the Ganges and the Jumna. This part falls naturally into two sections, divided by the deep and fissured valley of the river Sengar. The tract to the north-east of that stream is rich and fertile, being watered by the Cawnpore and Etawah branches of the Ganges canal, and other important works. The south-western region has the same natural advantages, but possesses no great irrigation system, and is consequently less fruitful than the opposite slopes. Near the banks of the Jumna, the plain descends into the river valley by a series of wild ravines and terraces, inhabited only by a scattered race of hereditary herdsmen. Beyond the Jumna again a strip of British territory extends along the tangled gorges of the Chambal and the Kauri Nadi, far into the borders of the Gwalior state. This outlying tract embraces a series of rocky glens and mountain torrents, crowned by the ruins of native strongholds, and interspersed with narrow ledges of culturable alluvium. The climate, once hot and sultry, has now become comparatively moist and equable under the influence of irrigation and the planting of trees.

Etawah was marked out by its physical features as a secure retreat for the turbulent tribes of the Upper Doab, and it was not till the 12th century that any of the existing castes settled on the soil. After the Mussulman conquests of Delhi and the surrounding country, the Hindus of Etawah appear to have held their own for many generations against the Mahomedan power; but in the 16th century Baber conquered the district, with the rest of the Doab, and it remained in the hands of the Moguls until the decay of their empire. After passing through the usual vicissitudes of Mahatta and Jat conquests during the long anarchy which preceded the British rule, Etawah was annexed by the wazir of Oudh in 1773. The wazir ceded it to the East India Company in 1801, but it still remained so largely in the hands of lawless native chiefs that some difficulty was experienced in reducing it to orderly government. During the mutiny of 1857 serious disturbances occurred in Etawah, and the district was occupied by the rebels from June to December; order was not completely restored till the end of 1858. In 1901 the population of the town of Etawah is 11%. In the district the main river is partly watered by branches of the Ganges canal, and is traversed throughout by the main line of the East Indian railway from Cawnpore to Agra. Cotton, oilseeds and other agricultural produce are exported, and some indigo is made, but manufacturing industry is slight.

Etching (Dutch, atsen, to eat), a form of engraving (q.v.) in which, in contradistinction to line engraving (q.v.), where the burrow is produced by the ploughing of the burin, the copper is eaten away or corroded by acid.

To prepare a plate for etching it is first covered with etching-ground, a composition which resists acid. The qualities of a ground are to be so adhesive that it will not quit the copper when a small quantity is left isolated between lines, yet not so adhesive that the etching point cannot easily and entirely remove it; at the same time a good ground will be hard enough to bear the hand upon it, or a sheet of paper, yet not so hard as to be brittle. The ground used by Abraham Bosse, the French painter and engraver (1602-1676) was composed as follows:—Melt 2 oz. of white wax; then add to it 1 oz. of gum-mastic in powder, a little at a time, stirring till the wax and the mastic are well mingled; then add, in the same manner, 1 oz. of bitumen in powder. There are three different ways of applying an etching-ground to a plate. The old-fashioned way was to wrap a ball of the ground in silk, heat the plate, and then rub the ball upon the surface, enough of the ground to cover the plate melting through the silk. To equalize the ground a dabber was used, which was made of cotton-wool under horsehair, the whole inclosed in silk. This method is still used by many artists, from tradition and habit, but it is far inferior in perfection and convenience to that which we will now describe. When the etching-ground is melted, add to it half its volume of essential oil of lavender, mix well, and allow the mixture to cool. You have now a paste which can be spread upon a cold plate with a roller; these rollers are covered with leather and made (very carefully) for the purpose. You first spread a little paste on a sheet of glass (if too thick, add more oil of lavender and mix with a palette knife), and roll it till the roller is quite equally charged all over, when the paste is easily transferred to the copper, which is afterwards gently heated to expel the oil of lavender. In both these methods of grounding a plate, the work is not complete until the ground has been smoked, which is effected as follows:—The plate is held by a hand-vice if a small one, or if large, is fixed at some height, with the covered side downwards. A smoking torch, composed of many thin bee's-wax-dips twisted
ETCHING

805
together, is then lighted and passed repeatedly under the plate in every direction, till the ground has incorporated enough lampblack to blacken it. The third way of covering a plate for etching is to apply the ground in solution as colloidion is applied by photographers. The ground may be dissolved in chloroform, or in oil of lavender. The plate being grounded, its back and edges are protected from the acid by Japan varnish, which soon dries, and then the etching is traced as before. The last way of tracing is to use a so-called etching gelatine, which is employed as follows. The gelatine is laid upon the drawing, which its transparency allows you to see perfectly, and you trace the lines by scratching the smooth surface with a sharp point. You then fill these scratches with fine black-lead, in powder, rubbing it in with the finger, turn the tracing with its face to the plate, and rub the back of it with a burnisher. The black-lead from the scratches adheres to the etching ground and shows upon it as pale grey, much more visible than anything else you can use for tracing. Then comes the work of the etching-needle, which is merely a piece of steel sharpened more or less. J. M. W. Turner used a prong of an old steel fork which did as well as anything, but neater etching-needles are sold by artists' colourmakers. The needle removes the ground or cover and lays the copper bare. Some artists sharpen their needles so as to present a cutting edge which, when used sideways, scrapes away a broad line; and many etchers use needles of various degrees of sharpness to get thicker or thinner lines. It may be well to observe, in connexion with this part of the subject, that whilst thick lines agree perfectly well with the nature of woodcut, they are very apt to give an unpleasant heaviness to plate engraving of all kinds, whilst thin lines have generally a clear and agreeable appearance in plate engraving. Nevertheless, lines of moderate thickness are used effectively in etching when covered with finer shading and very thick lines indeed were employed with good results by Turner when he intended to cover them with mezzotint (p.22); and to print in brown ink, because their thickness was essential to prevent them from being overwhelmed by the mezzotint, and the brown ink made them print less heavily than black. Etchers differ in opinion as to whether the needle ought to scratch the copper or simply to glide upon its surface. A gliding needle is much more free, and therefore communicates a greater appearance of freedom to the etching, but it has the inconvenience that the etching-ground may not always be entirely removed, and then the lines may be defective from insufficient biting. A scratching needle, on the other hand, is free from this serious inconvenience, but it must not scratch irregularly so as to engrave lines of various depth. The biting in former times was generally done with a mixture of nitric acid and water, in equal proportions; but in the present day a Dutch mordant is a good deal used, which is composed as follows: Hydrochloric acid, 100 grammes; chloride of potash, 10 grammes; water, 580 grammes. If the mixture be heated, add the chlorate of potash, wait till it is entirely dissolved, and then add the acid. The nitrous mordant acts rapidly and causes ebulition; the Dutch mordant acts slowly and causes no ebulition. The nitrous mordant widens the lines; the Dutch mordant bites in depth, and does not widen the lines to any perceptible degree. The time required for both depends upon temperature. A mordant bites slowly when cold, and more and more rapidly when heated. To obviate irregularity caused by difference of temperature, it is a good plan to heat the Dutch mordant artificially to 95° Fahr. by lamps under the bath (for which a photographer's porcelain tray is most convenient), and keep it steadily to that temperature; the results may then be counted upon; but whatever the temperature fixed upon, the results will be regular if it is regular. To get different degrees of biting on the same plate the lines which are to be pale are "stopped out" by being painted over with Japan varnish or with etching-ground dissolved in oil of lavender, the darkest lines being reserved to the last, as they have to bite longest. When the acid has done its work properly the lines are bitten in such various degrees of depth that they will print with the degree of blackness required; but if some parts of the subject require to be made paler, they can be lowered by rubbing them with charcoal and olive oil, and if they have to be made deeper they can be rebitten, or covered with added shading. Rebitting is done with the roller above mentioned, which is now charged very lightly with paste and rolled over the copper with no pressure but its own weight, so as to cover the smooth surface but not fill up any of the lines. The oil of lavender is then expelled as before by gently heating the plate, but it is not stopped out. The lines which require rebitting may now be rebitten, and the others preserved against the action of the acid by stopping out. These are a few of the most essential technical points in etching, but there are many matters of detail for which the reader is referred to the special works on the subject.

There are many varieties in the processes of etching, and it is only necessary here to indicate the essential facts. A brief analysis of different styles may be given.

(1) Pure Line. As there is line engraving, so there is line etching; but as the etching-needle is a freer instrument than the burin, the line has qualities which differ widely from those of the burin line. Each of the two has its own charm and beauty; the liberty of the one is charming, and the restraint of the other is admirable also in its right place. In line etching, as in line engraving, the great masters purposely exhibit the line and do not hide it under too much shading. (2) Line and Shade. This answers exactly in etching to Mantegna's work in engraving. The most important lines are drawn first throughout, and the shading, as a second thing, is broken in over them. (3) Shade and Texture. This is used chiefly to imitate oil-painting. Here the line (properly so called) is entirely abandoned, and the attention of the etcher is given to texture and chiaroscuro. He uses lines, of course, to express these, but does not exhibit them for their own beauty; on the contrary, he conceals them.

Of these three styles of etching the first is technically the easiest, and being also the most rapid, is adopted for sketching on the copper for nature; the second is the next in difficulty, and the third the most difficult, on account of the biting, which is never easy to manage when it becomes elaborate. The etcher has, however, many resources; he can make passages paler by burnishing them, or by using charcoal, or he can efface them entirely with the scraper and charcoal; he can darken them by rebiting or by regrounding the plate and adding fresh work; and he need not run the risk of biting the very palest passages of all, because these can be easily done with the dry point, which is simply a well-sharpened stylus used directly on the copper without the help of acid. It is often asserted that any one can etch who can draw, but this is a mistaken assertion likely to mislead. Without requiring so long an apprenticeship as the burin, etching is a very difficult art indeed, the two main causes of its difficulty being that the artist does not see his work properly, and he proceeds, and that he suffers accidents or misfortunes in the biting, which are of frequent occurrence to the inexperienced, may destroy all the relations of tone.

Etching, like line engraving, owed much to the old masters, but whereas, with the exception of Albert Dürrer, the painters were seldom practical line engravers, they advanced etching not only by advice given to others but by the work of their own hands. Rembrandt did as much for etching as either Raphael or Rubens for line engraving; and in landscape the etchings of Claude had an influence which still continues, both Rembrandt and Claude being practical workmen in etching, and very skilful workmen. Ostade, Ruysdael, Berghem, Paul Potter, Karl Dujardin, etched as they painted, and so did a greater than any of them, Vandyck. In the earlier part of the 19th century etching was almost a defunct art, except as it was employed by engravers as a help to get faster through their work, of which "engraving" got all the credit, the public being unable to distinguish between etched lines and lines cut with the burin. But from the middle of the century dates a great revival of etching as an independent art, a revival which has extended all over Europe.

Apart from the copying of pictures by etching—which was found commercially preferable to the use of line engraving—
a number of artists and amateurs gradually practised original etching with increasing success, notably Sir Seymour Haden, J. M. Whistler, Samuel Palmer and others in England, Felix Bracquemond, C. F. Daubigny, Charles Jacques, Adolphe Appian, Maxime Lalanne, Jules Jacquemart and others on the continent, besides that singular and remarkable genius, Charles Méryon. Etching clubs, or associations of artists for the publication of original etchings, were gradually founded in England, France, Germany and Belgium. Méryon and Whistler are two of the greatest modern etchers. Among the latter names many may be made of Andrew Geddes (1783–1844) and of Sir David Wilkie (1785–1841). Geddes was the finer artist with the needle; he it was whom Rembrandt best inspired; his work was in the grand manner. Of the rich and rare dry-points "At Peckham Rye" and "At Hallford-on-Thames," the deepest and most brilliant master of landscape would have no need to be ashamed. David Wilkie's prints were, naturally, not less dramatic than his pictures, but the etcher's particular gift was possessed by him more intermittently: it is shown best in "The Receipt," a strong and vivid, dexterous sketch, quite full of character. J. S. Cotman's (1782–1842) etchings are also historically interesting though they were "soft ground" for the most part. They show all his qualities of elegance and freedom as a draughtsman, and much of his large dignity in the distribution of light and shade. T. Girtin (1775–1802), in the preparations for his views of Paris, was notably happy. The work of Sir Frank Haden (1848–1918) had a powerful influence on the art in England. Between 1858 and 1875 Seymour Haden—the first president of the Royal Society of Painter-Etchers—produced the vast majority of his plates, which have always good draughtsmanship, unity of effect and a personal impression. They show a strong feeling for nature. If, amongst some two hundred subjects, it were necessary to select one or two for peculiar praise, they might be the "Breaking up of the Agamomion," the almost perfect "Water Meadow," the masterly presentation of "Marshes," and the later dry-point of "Windmill Hill." Another great etcher—Frenchman by birth, but English by long residence—is Alphonse Legros (q.v.). Great in expression and expressive draughtsmanship, austere and economical in line, Legros's work is the grave record of the observation and the fancy of an imaginative mind. In poetical portraiture nothing can well exceed his etched vision of G. W. Watts; "La Mort du Vagabond" is noticeable for terror and homely pathos; "Communion dans l'Eglise St M&ard" is perhaps the best instance of the dignity, vigour and grave sympathy with which he addresses himself to ecclesiastical themes. Some of these latter qualities, in dealing with similar themes, Legros passed on to his pupil, Sir Charles Holroyd (b. 1861)—an etcher in the true vein; whilst an earlier pupil, prolific as himself, as imaginative, and sometimes more deliberately uncouth—William Strang, A.R.A. (b. 1859)—carried on in his own way the tradition of that part of Legros's practice, the preoccupation with the humble, for which Legros himself found certain warrant in a portion of the great work of Rembrandt. Frank Short, A.R.A. (b. 1857), as with the very touch of Turner, carried to completion great designs that Turner left unfinished for the Liber studiorum. The delicacy of "Sleeping till the Flood," the curiously suggestive realism of "Wrought Nails"—a scene in the Black Country—entitle him to a lasting place in the list of the fine welders of the etching-needle. D. Y. Cameron (b. 1865) betrays the influence of Rembrandt in a noble etching, "Border Towers," and the influence of Méryon in such a print as that of "The Palace, Stirling." His "London Set" is particularly fine. The individuality of C. J. Watson is less marked, but his skill, chiefly in architectural work, is noticeable. Admirers of the studiously accurate portraiture of a great monument may be able to set Watson's print of "St Etienne du Mont" by the side of Méryon's august and mysterious and ever-moving vision. For Hollow's (b. 1858) brilliant sketches, particularly of women, has used the art of etching in a peculiarly individual and delightful way. Among the numerous other modern etchers only a bare mention can be made of Oliver Hall, Minna Bolingbroke and Elisabeth Armstrong (Mrs Watson and Mrs Stanhope Forbes), Alfred East, Robert Macbeth, Walter Sickert, Robert Goff, Mortimer Menpes, Percy Thomas, Raven Hill, and Prof. H. von Herkomer, in England; in France, Roussel, J. F. Raffaelli (b. 1850), Bensard and J. J. J. Tissot (1836–1902). The oldest treatise on etching is that of Abraham Bosse (1645). See also P. G. Hamerton, Etchings and Etchers (1868), and Etchers' Handbook (1881); F. Wedmore, Etching in England (1893); Singer and Strafig, Etching, Engraving, etc. (1897).

ETECOLES, in Greek legend, king of Thebes, son of Oedipus and Jocasta (Jocaste). After their father had been driven out of the country, he and his brother Polynices agreed to reign alternately for a year. Eteocles, however, refused to keep the treaty and Polynices fled to Adrastus, king of Argos, whom he persuaded to undertake the famous expedition against Thebes on his behalf. The two brothers met in single combat, and both were slain. The Theban rulers decreed that only Eteocles should receive the honour of burial, but the decree was set at naught by Antigone (q.v.), the sister of Polynices. The fate of Eteocles and Polynices forms the subject of the Seven against Thebes of Anaxagoras and the Phoenix of Euripides.

EYESIAN WIND (Lat. aestius, annual; Gr. ετειος, year), a Mediterranean wind blowing from the north and west in summer for about six weeks annually.

ÉTEX, ANTOINE (1806–1888), French sculptor, painter, and architect, was born in Paris on the 20th of March 1806. He first exhibited in the salon of 1833, his work including a reproduction in marble of his "Death of Hyacinthus," and the plaster cast of his "Cain and his race cursed by God." Thiers, who was at this time minister of public works, now commissioned him to execute the two groups of "Peace" and "War," placed at each side of the Arc de Triomphe. This last, which established his reputation, he reproduced in marble in the salon of 1839. The French capital contains numerous examples of the sculptural works of Étex, which included mythological and religious subjects besides a great number of portraits. His paintings include the subjects of the Eurydice and the martyrdom of Saint Sebastian, and among the best known of his architectural productions are the tomb of Napoleon I. in the Invalids and a monument of the revolution of 1848. Étex wrote a number of essays on subjects connected with the arts. The last year of his life was spent at Nice, and he died at Chaville (Seine-et-Oise) on the 14th of July 1888.

ETHER, (C₂H₅)₂O, the Askér of pharmacy, a colourless, volatile, highly inflammable liquid, of specific gravity 0.736 at 0°, boiling-point 35° C., and freezing-point 117° 4 C. (K. Olsewski). It has a strong and characteristic odour, and a hot sweetish taste, is soluble in ten parts of water, and in all proportions in alcohol, and dissolves boracic acid, and, in small quantities, sulphur and phosphorus, also the volatile oils, most latty and resinous substances, guncotton, caoutchouc and certain of the vegetable alkaloids. The vapour mixed with oxygen or air is violently explosive. The making of ether by the action of sulphuric acid on alcohol was known in about the 13th century; and later Basil Valentine and Valerius Cordus described its preparation and properties. The name ether appears to have been applied to the drug only since the times of Frobenius, who in 1730 termed it spiritus aetherius or vini viridulus. It was considered to be a sulphur compound, hence its name sulphur ether; this idea was proved to be erroneous by Valentine Reclus in about 1800. Ether is manufactured by the distillation of 5 parts of 90° alcohol with 0 parts of concentrated sulphuric acid at a temperature of 140°–145° C., a constant stream of alcohol being caused to flow into the mixture during the operation. The distillate is purified by treatment with lime and calcium chloride, and subsequent distillation. The mechanism of this reaction was explained by A. Williamson in 1850. For other methods of preparation see Ethers.

The presence of so small a quantity as 1% of alcohol may be detected in ether by the colour imparted to it by aniline violet; if water or acetic acid be present, the ether must be shaken with anhydrous potassium carbonate before the application of the test. When heated with zinc dust, it yields ethylene and water. Chromic acid oxidizes it to acetic acid and ozone oxidizes it to ethyl peroxide. In contact with hydroiodic acid gas at °C, it forms ethyl iodide (R. D. Silva, *Ber.*, 1875, 8, p. 903), and with water and a little sulphuric acid at °C, it yields alcohol (E. Erlenmeyer, *Zeit. f. chemie*, 1868, p. 343). It forms crystalline compounds with bromine and with many metallic salts.

**Medicine.**—For the anaesthetic properties of ether see *Anaesthesia*. Applied externally, ether evaporates very rapidly, producing such intense cold as to cause marked local anaesthesia. For this purpose it is best applied as a fine spray, but ethyl chloride is generally found more efficient and produces less subsequent discomfort. It aids the absorption of fats and may be used with cod liver oil when the latter is administered by the skin. If it be rubbed in or vaporized be prevented, it acts, like alcohol and chloroform, as an irritant. Ten to twenty minims of ether, subcutaneously injected, constitute perhaps the most rapid and powerful cardiac stimulant known, and are often employed for this purpose in cases of syncope under anaesthesia. Taken internally, ether acts in many respects similarly to alcohol and chloroform, but its stimulant action on the heart is much more marked, being last observed both in response from the stomach and directly after its rapid absorption. Ether is thus the type of a rapidly diffusible stimulant. It is also useful in relieving the paroxysms of asthma. The dose for repeated administration is from 10 to 30 minims and for a single administration up to a drachm.

**Chronic Poisoning.**—A dose of a little more than a drachm (a teaspoonful) will produce a condition of inebriation lasting for one-half to one hour, but the dose must soon be greatly increased. The after-effects are, if the habit of ether drinking is certainly not so injurious as alcoholism. The principal symptoms of chronic ether-drinking are a weakening of the activity of the specific senses, and notably sight and hearing, a lowering of the intelligence and a degree of general paresis (partial paralysis) of motion.

** Etheredge** [or Etheredge], **Sir George** (c. 1635–1691), English dramatist, was born about the year 1635, and belonged to an Staffordshire family. He is said to have been educated at Cambridge, but Dennis assures us that "to his certain knowledge he understood neither Greek nor Latin." He travelled abroad early, and seems to have resided in France. It is possible that he witnessed in Paris the performances of some of Molière's earliest comedies; and he seems, from an allusion in one of his plays, to have been personally acquainted with Bussy Rabytin. On his return to London he studied the law at one of the Inns of Court. His tastes were those of a fine gentleman, and he indulged freely in pleasure.

Sometime soon after the Restoration he composed his comedy of *The Comical Revenge or Love in a Tub*, which introduced him to Lord Buckhurst, afterwards the earl of Dorset. This was brought out at the Duke's theatre in 1664, and a few copies were printed in the same year. It is partly in rhymed heroic verse, like the stilted tragedies of the Howards and Killigrews, but it contains comic scenes that are exceedingly bright and fresh. The sparring between Sir Frederick and the Widow introduced a style of wit hitherto unknown upon the English stage. The success of this play was very great, but Etheredge waited four years before he repeated his experiment. Meanwhile he gained the highest reputation as a poetical beau, and moved in the circle of Sir Charles Sedley, Lord Rochester and the other noble wits of the day. In 1666 he brought out *She would if she could*, a comedy in many respects admirable, full of action, wit and spirit, but it was not as successful as its predecessor. But in this play Etheredge first shows himself a new power in literature; he has nothing of the rudeness of his predecessors or the grossness of his contemporaries. We move in an airy and fantastic world, where flirtation is the only serious business of life. At this time Etheredge was living a life no less frivolous and unprincipled than those of his Courtals and Freemans. He formed an alliance with the famous actress Mrs Elizabeth Barry; she bore him a daughter, on whom he settled £600, but who, unhappily, died in her youth. His wealth and wit, the distinction and charm of his manners, won Etheredge the general worship of society, and his temperament is best known by the names his contemporaries gave him, of "gentle George" and "easy Etheredge." Rochester upbraided him for inattention to literature; and at last, after a silence of eight years, he came forward with one more play, unfortunately his last. The *Man of Mode* or *Sir Fopling Flutter*, indisputably the best comedy of intrigue written in England before the days of Congreve, was acted and printed in 1676, and enjoyed an unbounded success. Besides the merit of its plot and wit, it had the personal charm of being supposed to satirize, or at least to paint, persons well known in London. Sir Fopling Flutter was a portrait of Beau Hewitt, the reigning exquisites of the hour; in Dornitz the poet drew the earl of Rochester, and in Medley a portrait of himself; while even the drunken shoemaker was a real character, who made his fortune from being thus brought into public notice. After this brilliant success Etheredge retired from literature; his gallantries and his gambling in a few years deprived him of his fortune, and he looked about for a rich match. He was knighted before 1680, and gained the hand and the money of a rich widow. He was sent by Charles II. on mission to the Hague in 1672, and was appointed resident minister in the imperial German court at Regensburg. He was very uncomfortable in Germany, and after three and a half years' residence left for Paris. He had collected a library at Regensburg, some volumes of which are in the theological college there. His MS. despatches are preserved in the British Museum, where they were discovered and described by Mr Gosse in 1881; they add very largely to our knowledge of Etheredge's career. He died in Paris, probably in 1691, for Narcissus Luttrell noted in February 1692, "Sir George Etheredge, the late King James' ambassador to Vienna, died lately in Paris."

Etheredge deserves to hold a more distinguished place in English literature than has generally been allotted to him. In a dull and heavy age, he inaugurated a period of genuine wit and sprightliness. He invented the comedy of intrigue, and led the way for the masterpieces of Congreve and Sheridan. Before his time the manner of Ben Jonson had prevailed in comedy, and traditional "humours" and typical eccentricities, instead of real characters, had crowded the comic stage. Etheredge paints with a light, faint hand, but it is from nature, and his portraits of fops and beaux are simply unexcelled. No one knows better than he how to present a gay young gentleman, a Dorimant, "an unconfamblereoverser amorous adventures." His genius is alight as thistle-down; he is frivolous, without force of conviction, without principle; but his wit is very sparkling, and his style pure and singularly picturesque. No one approaches Etheredge in the art of delicate touches of dress, furniture and scene; he makes the fine airs of London gentlemen and ladies live before our eyes even more vividly than Congreve does; but he has less insight and less energy than Congreve. Had he been poor or ambitious, he might have been to England almost what Molière was to France; but he was a rich man living at his ease, and he disdained to excel in literature. Etheredge was "a fair, slender, genteel man, but spoiled his countrymen with drinking." His contemporaries all agree in acknowledging that he was the soul of affability and sprightly good-nature.

The life of Etheredge was first given in detail by Edmund Gosse in *Seventeenth Century Studies* (1883). His works were edited by A. W. Vertue, in 1888.

**Etheredge, John Wesley** (1684–1666), English non-conformist divine, was born near Newport, Isle of Wight, on the 24th of February 1684. He received most of his early education from his grandfather and afterwards at Merton. He acquired ultimately a thorough knowledge of Greek, Latin, Hebrew, Syriac, French and German. In 1684 he was placed on the Wesleyan Methodist plan as a local preacher. In 1686 his father entered to the ministry the plan was accepted, and after the usual
ETHERIDGE—ETHICS

probationary trial he was received into full connexion at the conference of 1831. For two years after this he remained at Brighton, and in 1833 he removed to Cornwall, being stationed successively at the Truro and Falmouth circuits. From Falmouth he removed to Darlaston, where in 1838 his health gave way. For a good many years he was a Supernumerary, and lived for a while at Caen and Paris, where in the public libraries he found great facilities for prosecuting his favourite Oriental studies. His health having considerably improved, he became, in 1843, pastor of the Methodist church at Boulogne. He returned to England in 1847, and was appointed successively to the circuits of Islington, Bristol, Leeds, Penzance, Penryn, Truro and St Austell in East Cornwall. Shortly after his return to England he received the degree of Ph.D. from the university of Heidelberg. He was a patient, modest, hard-working and accurate scholar. He died at Camborne on the 74th of May 1866.

His principal works are: Horae Aromatice (1843); History, Liturgies and Literature of the Syrian Churches (1847); The Apostolic Acts and Epistles, from the Peshito or Ancient Syriac (1849); Jerusalem and Thessaly, a Survey of the Religious and Scholastic Learning of the Jews and Greeks (1851). They are amongst the works of Jonathan ben Uziel (1st vol. in 1862, 2nd in 1865). See Memoir by Rev. Thorney Smith (1871).

ETHERIDGE, ROBERT (1819—1903), English geologist and palaeontologist, was born at Ross, in Herefordshire, on the 3rd of December 1819. After an ordinary school education in his native town, he obtained employment in a business house in Bristol. There he devoted his spare time to natural history pursuits, and in 1850 was appointed curator of the museum attached to the Bristol Philosophical Institution. He also became lecturer on botany in the Bristol medical school. In 1857, through the influence of Sir Roderick J. Murchison, he was appointed to a post in the Museum of Practical Geology in London, and eventually became palaeontologist to the Geological Survey. In 1865 he assisted Prof. Huxley in the preparation of a Catalogue of Fossils in the Museum of Practical Geology. His chief work for many years was in naming the fossils collected during the progress of the Geological Survey, and in supplying the lists that were appended to numerous official memoirs. In this way he acquired an exceptional knowledge of British fossils, and he ultimately prepared an elaborate work entitled Fossils of the British Islands, Stratigraphically and Geologically arranged. Only the first volume dealing with the Palaeozoic species was published (1888). Etheridge also was author of several papers on the Rhaetic Beds, and of an important essay on the Physical Structure of North Devon, and on the Palaeontological Value of the Devonian Fossils (1867). He edited, and in the main rewrote, the second part of a new edition of John Phillips' Manual of Geology—entitled Stratiographical Geology and Palaeontology (1885). He was elected F.R.S. in 1871, and was president of the Geological Society in 1881—1883. Etheridge was transferred from the Geological Survey to the geological department of the British Museum, where he served as assistant keeper until 1891. He died at Chelsea, London, on the 18th of December 1903.

Memoir by Dr Henry Woodward (with list of works and portrait) in Geological Magazine, January 1904; also Memoir by H. B. Woodward in Proc. Brit. Assoc. Sec. x. 175.

ETHERS, in organic chemistry, compounds of the general formula R-O-R', where R, R' = alkyl or aryl groups. They may be regarded as the anhydrides of the alcohols, being formed by elimination of one molecule of water from two molecules of the alcohol; those in which the two hydrocarbon radicals are similar are known as simple ethers, and those in which they are dissimilar as mixed ethers. They may be prepared by the action of concentrated sulphuric acid on the alcohol, or alkaline sulphuric acids being first formed, which yield ethers on heating with alcohols. The process may be made a continuous one by running a thin stream of alcohol continually into the heated reaction mixture of alcohol and sulphuric acid. Benzene sulphonic acid has been used in place of sulphuric acid (F. Kraft, Ber., 1893, 26, p. 2839). A. W. Williamson (Ann., 1851, 77, p. 38; 1852, 81, p. 77) prepared ether by the action of sodium ethylate on ethyl iodide, and showed that all ethers must possess the structural formula given above (see also Brit. Assoc. Reports, 1850, p. 65). They may also be prepared by heating the alkyl halides with silver oxide.

The ethers are neutral volatile liquids (the first member, methyl ether, is a gas at ordinary temperature). Phosphorus pentachloride converts them into alkyl chlorides, a convenient decomposition taking place when they are heated with the haloid acids. Nitric acid and chromic acid oxidize them in such a manner that they yield the same products as the alcohols from which they are derived. With chlorine they yield substitution products.

Methyl ether, (CH₃)₂O, was first prepared by J. B. Dumas and E. Péligot (Ann. chim. phys., 1835, [2] 58, p. 19) by heating methyl alcohol with sulphuric acid. It is best prepared by heating methyl alcohol and sulphuric acid to 140° C and leading the evolved gas into sulphuric acid. The sulphuric acid solution is then allowed to drop slowly into an equal volume of water, when the methyl ether is liberated (E. Erlenmeyer and A. Kriechebaum, Ber., 1874, 97, p. 690). It is a pleasant-smelling gas, which burns when ignited, and may be condensed to a liquid which boils at 23-6° C. It is somewhat soluble in water and readily soluble in alcohol, and concentrated sulphuric acid. It combines with hydrochloric acid gas to form a compound (CH₃O)₂C=Cl (C. Friedel, Comptes rendus, 1875, 81, p. 152).

Methyl ethyl ether, CH₃O-C₂H₅, is prepared from methyl iodide and sodium ethylate, or from ethyl iodide and sodium methylate (A. W. Williamson, Ann., 1852, 81, p. 77). It is a liquid which boils at 10-8° C.

For diethyl ether see ETHER, and for methyl phenyl ether (anisole) and ethyl phenyl ether (phenetole) see CARBOLIC ACID.

ETHICS, the name generally given to the science of moral philosophy. The word "ethics" is derived from the Gr. ἔθικος, which pertains to ἴθα, character.

For convenience in reference, the arrangement followed in this article may be explained at the outset:

I. DEFINITION AND SCOPE
II. HISTORICAL SKETCH

A. Greek and Graeco-Roman Ethics
   The Age of the Sophists
   Socrates and his Disciples
   Plato
   Plato and Aristotle
   Aristotle
   Stoicism
   Hedonism (Epicurus)
   Later Greek and Roman Ethics
   Neoplatonism

B. Christianity and Medieval Ethics
   Christian and Jewish "Law of God"
   Christian and Pagan Inwardness
   Distinctive Particulars of Christian Morality
   Development of Opinion in Early Christianity
   Augustine, Ambrose
   Medieval Morality and Moral Philosophy
   Thomas Aquinas
   Casuistry and Jusiusmay
   The Reformation; and birth of Modern Thought

C. Modern Ethics
   Grotius
   Hobbes
   The Cambridge Moralists
   (Cudworth, More)
   Cumberland
   Locke
   Clarke
   Shaftesbury
   Mandeville
   Butler
   Wollaston
   Hutcheson
   Hume
   Adam Smith
   The Intuitional School
   (Price, Reid, Stewart, Whewell)
   The Utilitarian School
   (Paley, Bentham, Mill)
Section I. contains a general survey of the subject; it shows in what sense ethics is to be regarded as a special field of philosophical investigation — its relations to other departments of thought, especially to psychology, religion and modern physical science. The article may be taken to give a detailed, casuistical examination of the matter of ethical theory. For this, reference must be made to special articles on philosophic schools, writers and terms.

Section II. is a historical sketch in four parts tracing the main lines of development in ethical speculation from its birth to the present day. Here again it has been possible to notice only the more prominent phases of the history of ethics as above. All important writers whose names occur in this sketch are treated in special biographical articles, and references are given as often as possible to supplementary articles which illustrate and explain points which cannot be fully treated here. This is especially the case in connexion with technical terms (whose history and meaning are inevitably taken for granted) and biographical information about minor ethical writers.

I. DEFINITION AND SUBJECT-MATTER OF ETHICS

In its widest sense, the term "ethics" would imply an examination into the general character or habits of mankind, and would even involve a description or history of the habits of men in particular societies living at different periods of time. Such a field of study would obviously be too wide for any particular science or philosophy to investigate, and is moreover partitioned and are already occupied by history, by anthropology and by the particular sciences (e.g. physiology, anatomy, biology), in so far as the habits and character of men depend upon the material processes which these sciences examine. Even philosophies such as logic and aesthetic would be necessary for such an investigation, if thought and artistic production are normal human habits and elements in character. Ethics then is usually confined to the particular field of human character and conduct so far as they depend upon our exhibit certain general principles commonly known as moral principles. Men in general characterize their own conduct and character and that of other men by such general adjectives as good, bad, right, and wrong, and it is the meaning and scope of these adjectives, primarily in relation to human conduct, and ultimately in their final and absolute sense, that ethics investigates.

A not uncommon definition of ethics as the "science of conduct" is inexact for reasons. The sciences are descriptive or experimental. But a description of what acts or what ends of action men in the present or the past call, or have called, "good" or "bad" is clearly beyond human powers. And experiments in morality (apart from the inconvenient practical consequences likely to ensue) are useless for purposes of ethics, because the moral consciousness would itself at one and the same time be required to make the experiment and to provide the subject upon which the experiment is performed. (4) Ethics is a philosophy and not a science. Philosophy is a process of reflection upon the presuppositions involved in unreflective thought. In logic and metaphysics it investigates either the process of apprehension itself, or conceptions such as cause, substance, space, time, which the ordinary scientific consciousness never criticizes. In moral philosophy the place of the body of sciences, which philosophy as the theory of knowledge investigates, is taken by the developed moral consciousness, which already forms a large part of moral judgment, without claiming authority to subject to continual criticism the institutions and forms of social life which it has itself helped to create.

When ethical speculation first begins, conceptions such as those of duty, responsibility, the will as the ultimate subject of moral approbation and disapprobation, are already in existence and already operative. Moral philosophy in a certain sense adds nothing to these conceptions, though it sets them in a clearer light. The problems of the moral consciousness at the time at which it first becomes reflective are not strictly speaking philosophical problems at all. It is occupied with just such questions as each individual man who wishes to act rightly is constantly called upon to answer, e.g. questions such as "What particular action will meet the claims of justice under such and such circumstances?" or "What degree of ignorance will excuse this particular person in this particular case from his responsibility?" It tries to attain a knowledge as complete as possible of the circumstances under which the act contemplated must be performed, the personalities of the persons whom it may affect, and the consequences (so far as they can be foreseen) which it will produce, and then by virtue of its own power of moral dissection pronounces a pronouncement. Again, it is the problem of the moral consciousness, "What ought to be done?" which is one which receives a clearer and more definite answer as men become more able in the course of moral experience to apply those principles of the moral consciousness which are yet employed in that experience from the outset. Nevertheless there is a sense in which moral philosophy may be said to originate out of difficulties inherent in the nature of morality itself, although it remains true that the questions which ethics attempts to answer are not questions with which the moral consciousness, as such is confronted. The fact that men give different answers to moral problems which seem similar in character, or even the mere fact that men disregard, when they act immorally, the dictates and implicit principles of the moral consciousness is certain sooner or later to produce the desire either, on the one hand, to justify immoral action by casting doubt upon the authority of the moral consciousness and the validity of its principles, or, on the other hand, to justify particular moral judgments either by (the only valid method) an analysis of the moral principle involved in the judgment and a demonstration of its universal acceptance, or by some attempt to prove that the particular moral judgment is arrived at by a process of inference from some universal conception of the Supreme Good or the Final End from which all particular duties or virtues may be deduced. It may be that criticism of morality first originates with a criticism of existing moral institutions or codes of ethics; such a criticism may be due to the spontaneous activity of the moral consciousness itself. But when such criticism passes into the attempt to find a universal criterion of morality—such an attempt being in effect an effort to make morality scientific—and especially when the attempt is seen, as it must in the end be seen, to fail (the moral consciousness being superior to all standards of morality and realizing itself wholly in particular judgments), then ethics as a process of action upon the nature of the moral consciousness is said to begin. If this be true it follows that one of the chief functions of ethics must be criticism of mistaken attempts to find a criterion of morality superior to the pronouncements of the moral consciousness itself. The ultimate superiority of the moral consciousness over all other standards is recognized, even by those who impugn its authority, whenever they claim that all men ought to recognize the superior value of the standards which they themselves wish to substitute. Similarly, their opponents refute their arguments by showing that they are based ultimately upon a recognition of certain distinctions which are moral distinctions (i.e. imply a moral consciousness capable of discriminating between right and wrong in particular cases), and that these moral distinctions conflict with the conclusions which they reach.

This may briefly be illustrated by reference to some of the great fundamental controversies of ethics. None of these controversies originate out of conflicting statements of the moral consciousness, i.e. there is no fundamental contradiction in morality itself. No one (if unsophisticated) ever confused the conception of pleasure with the conception of the Good, or thought that the claims of selfish interest were identical with those of duty. But the controversy between hedonists and antithedonists originates as soon as men reflect that a good which is not in some sense "my" good is not good at all, or that no act can be said to be moral which does not satisfy "me." Or, again, the
reflection that the mark or sign of the perfect performance of a particular virtuous act or function is the presence of a characteristic pleasure which always accompanies it, is opposed to the reflection that it is a mark of the highest morality never to rest satisfied, and out of these seemingly contradictory statements of the reflective consciousness might arise a multitude of controversies either concerning pleasure and duty, or the even more difficult and complex conceptions of merit, progress, and the nature of the Supreme Good or Final End. When and how fresh controversies in ethics will begin it will be impossible for any one to foretell. Sometimes the dominance of a particular science or branch of study is the occasion of an attempt to apply to ethics ideas borrowed from or analogous to the conceptions of that science. False analogies drawn between ethics and mathematics or between morality and the perception of beauty have wrought much mischief in modern and to some degree even in ancient ethics. The influence of ideas borrowed from biology is everywhere manifest in the ethical speculations of modern times. Sometimes, again, whole theories of ethics have been formulated which can be seen in the end to be efforts to subordinate moral conceptions to conceptions belonging properly to institutions or departments of human thought and activity which the moral consciousness has itself originated. Law, for instance, depends, or at least ought to depend, upon men's need for and consciousness of justice. And such institutions as the family and the state are created by the social consciousness, which is the moral consciousness from another aspect. Yet morality has been subordinated to legal and social sanctions, and moral advance has been held to be conditioned by political and social necessities which are not moral needs. Similarly no one since civilization emerged from barbarism has ever really been willing to yield allegiance to a deity who is not moral in the fullest and highest sense of the word. God is not superior to moral law. Yet there have been whole systems of theological ethics which have attempted to base human morality upon the arbitrary will of God or upon the supreme authority of a divinely inspired book or code of laws. One of the greatest of all ethical controversies, that concerning the freedom of the will, arose directly out of what was in reality a theological problem—the necessity, namely, of reconciling God's foreknowledge with human freedom. The unreflective moral consciousness never finds it difficult to distinguish between a man's power of willing and all the forces of circumstance, heredity and the like, which combine to form the temptations to which he may yield or bid defiance; and such facts as "remorse" and "penitence" are a continual testimony to man's sense of freedom. But so soon as men perceive upon reflection an apparent discrepancy between the utterances of their moral consciousness and certain conclusions to which the speculative (or at a later period metaphysical and scientific inquiries) seems inevitably to lead them, they will not rest satisfied until the belief in the will's freedom (hitherto unquestioned) is upon further reflection justified or condemned. It is clear then that the complexity of the subject-matter of ethics is such that no sharply defined boundary lines can be drawn between it and other branches of inquiry. Just in so far as it presupposes the apprehension of moral facts, it must presuppose a knowledge of the system of social relationships upon which some at least of those facts depend. And, for instance, for the inquirers into the nature of justice without being further compelled to undertake an examination of the nature of the state.

It would be difficult to decide how much of the dispute between the advocates of pleasure theories and their opponents turns upon vexed questions of psychology, and how much is strictly relevant to ethics. If, as has already been said, one of the chief tasks of ethics is to prevent the intrusion into its proper sphere of ideas borrowed from other and alien sources, then obviously these sources must be investigated. One example of this necessity may be given. It is sometimes maintained that the proper method of ethics is the psychological method; ethics, we are told, should examine as its subject-matter moral sentiments wherever found, without raising ultimate questions as to the nature of obligation or moral authority in general. Now if in opposition to such arguments the ultimate character of moral obligation be defended, it will be necessary to point out that no one feels moral sentiments except in connexion with particular objects of moral approbation or disapprobation (e.g. gratitude is inexpressible apart from a particular relationship existing between two or more persons), and that these objects are objects of the moral consciousness alone. But such a line of argument is certain to make necessary an inquiry into the nature of the objects of psychological study which may produce quite unforeseen results for psychology.

Nothing therefore is to be gained by confining ethics within limits which must from the nature of the case be arbitrary. The defender at all events of the supremacy of moral intuitions must be prepared to follow whither the argument leads, into whatever strange quarters it may direct him. But this much may be said by way of delimitation of the scope of ethics: however complicated and involved its arguments and processes of inference may become, the facts from which they start and the conclusions to which they point are such as the moral consciousness alone can understand or warrant. (H. H. W.)

II. HISTORICAL SKETCH

A. Greek and Graeco-Roman Ethics.—The ethical speculation of Greece and therefore the Greek idea of happiness has its roots in both ancient and modern movements. The naive and fragmentary concepts of conduct, which are everywhere the earliest manifestation of nascent moral reflection, are a noteworthy element in the gnostic poetry of the 7th and 6th centuries B.C. Their importance is shown by the traditional enumeration of the Seven Sages of the 6th century, and their influence on ethical thought is attested by the references of Plato and Aristotle. But from these unscientific utterances to a philosophy of morals was a long process. In the practical wisdom of Socrates (q.v.), one of the seven, we cannot discern any systematic theory of morality. In the case of Pythagoras, conspicuous among pre-Socratic philosophers as the founder not merely of a school, but of a sect or order bound by a common rule of life, there is a closer connexion between moral and metaphysical speculation. The doctrine of the Pythagoreans that the essence of justice (conceived as equal retribution) was a square number, indicates a serious attempt to extend to the region of conduct their mathematical view of the universe; and the same may be said of their classification of good with unity, straightness and the like, and of evil with the opposite qualities. Still, the enunciation of the moral precepts of Pythagoras appears to have been dogmatic, or even prophetic, rather than philosophic, and to have been accepted by his disciples with an unphilosophic reverence as the ipse dixit1 of the master. Hence, whatever influence the Pythagorean blending of ethical and mathematical notions may have had on Plato, and, through him, on later thought, we cannot regard the school as having really forestalled the Socratic inquiry after a completely reasoned theory of conduct. The ethical element in the "dark" philosophy of Heraclitus (c. 530-470 B.C.), though it anticipates Stoicism in its conceptions of a law of the universe, to which the wise man will carefully conform, and a divine harmony, in the recognition of which he will find his true satisfaction, is more profound, but the philosophical notions less systematic. It is only when we come to Democritus, a contemporary of Socrates, the last of the original thinkers whom we distinguish as pre-Socratic, that we find anything which we can call an ethical system. The fragments that remain of the moral treatises of Democritus are sufficient, perhaps, to convince us that the turn of Greek philosophy in the direction of conduct, which was actually due to Socrates, would have taken place without him, though in a less decided manner; but when we compare the Democritean ethics with the fragmentary system to which it has most affinity, Epicureanism, we find that it exhibits a very rudimentary apprehension of the formal conditions which moral teaching must fulfill before it can lay claim to be treated as scientific.

1 This well-known phrase was originally attributed to the Pythagoreans.
The truth is that no system of ethics could be constructed until attention had been directed to the vagueness and inconsistency of the common moral opinions of mankind. For this purpose was needed the concentration of a philosophic intellect of the first order on the problems of practice. In Socrates first we find the required combination of a paramount interest in conduct and an ardent desire for knowledge. The pre-Socratic thinkers were all primarily devoted to ontological research; but by the middle of the 5th century B.C. the contact of the Hellenistic systems had led some of the keenest minds to doubt the possibility of penetrating the secret of the physical universe. This doubt found expression in the reasoned scepticism of Gorgias, and produced the famous proposition of Protagoras, that human apprehension is the only standard of existence. The same feeling led Socrates to abandon the old physico-metaphysical inquiries. In his case, moreover, it was strengthened by a naive piety that forbade him to search into things of which the gods seemed to have reserved the knowledge to themselves. The regulation of human action, on the other hand (except on occasions of special difficulty, for which omens and oracles might be vouchsafed), they had left to human reason. On this accordingly Socrates concentrated his efforts.

Though, however, Socrates was the first to arrive at a proper conception of the problems of conduct, the general idea did not originate with him. The naive piety which wished for his service, the metaphysical and ethical dogmatism of the early thinkers had reached its climax in the Sophists (q.v.). Gorgias and Protagoras are only representatives of what was really a universal tendency to abandon dogmatic theory and take refuge in practical matters, and especially, as was natural in the Greek city-state, in the civic relations of the citizen. The education given by the Sophists aimed at no general theory of life, but at the art of getting on in the world and of managing public affairs. In their eulogy of the virtues of the citizen, they pointed out the prudential character of justice and the like as a means of obtaining pleasure and avoiding pain. The Greek conception of society was such that the life of the free-born citizen consisted mainly of his public function, and, therefore, the pseudo-ethical disquisitions of the Sophists satisfied the requirements of the age. None thought of virtus (virtue or excellence) as a unique quality possessed of an intrinsic value, but as the virtue of the citizen, just as good flute-playing was the virtue of the flute-player. We see here, as in other activities of the age, a determination to acquire technical knowledge, and to apply it directly to the practical issue; just as music was being enriched by new technical knowledge, architecture by modern theories of plans and T-squares (sc. Hippodamus), the handling of soldiers by the new technique of "tactics" and "hoplities," so citizenship must be expanded at the expense of virtues as a means of managing, and who could be against it if the Socratic creed was "No one would deny that justice and virtue generally are goods, and of all goods the best." All virtues are, therefore, summed up in knowledge of the good. But this good is not, for Socrates, duty as distinct from interest. The force of the paradox depends upon a blending of duty and interest in the single notion of good, a blending which was dominant in the common thought of the age. This is which forms the kernel of the positive thought of Socrates according to Xenophon. He could give no satisfactory account of Good in the abstract, and evaded all questions on this point by saying that he knew "no good that was not good for something in particular," but that good is consistent with itself. For himself he prized above all things the wisdom that is virtue, and in the task of producing it he endured the hardest penury, maintaining that such life was richer in enjoyment than a life of luxury. This many-sidedness of view is illustrated by the curious blending of noble and merely utilitarian sentiment in his account of friendship: a friend who can be of no service is valueless; yet the highest service that a friend can render is moral improvement.

The historically important characteristics of his moral philosophy, if we take (as we must) his teaching and character together, may be summarized as follows:—(1) an ardent inquiry for knowledge nowhere to be found, but which, if found, would be used not for one's own good, and would get it if he could and "No one would deny that justice and virtue generally are goods, and of all goods the best." All virtues are, therefore, summed up in knowledge of the good. But this good is not, for Socrates, duty as distinct from interest. of the universe, and thus to pass from ethics to metaphysics. Others again, whose demand for knowledge was more easily satisfied, and who were more impressed with the positive and practical side of the master’s teaching, made the quest a much simpler affair. They took the Good as already known, and held philosophy to consist in the steady application of this knowledge to conduct. Among these were Antisthenes the Cynic and Aristippus of Cyrene. It is by their recognition of the duty of living consistently by theory instead of mere impulse or custom, their sense of the new value given to life through this rationalization, and their effort to maintain the easy, calm, unwavering firmness of the Socratic temper, that we recognize both Antisthenes and Aristippus as “Socratic men,” in spite of the completeness with which they divided their master’s positive doctrine into systems diametrically opposed. Of their contrasting principles we may perhaps say that, while Aristippus took the most obvious logical step for reducing the teaching of Socrates to clear dogmatic unity, Antisthenes certainly drew the most natural inference from the Socratic life.

Aristippus (see CYRENEANS) argued that, if all that is beautiful or admirable in conduct has this quality as being useful, i.e. productive of some further good; if virtuous action is essentially action of discernment, i.e. apprehension of the act as a means to this good, this good must be pleasure. Bodily pleasures and pains Aristippus held to be the keenest, though he does not seem to have maintained this on any materialistic theory, as he admitted the existence of purely mental pleasures, such as joy in the prosperity of one’s native land. He fully recognized that his good was capable of being realized only in successive parts, and gave even exaggerated emphasis to the rule of seeking the pleasure of the moment, and not troubling oneself about a dubious future. It was in the calm, resolute, skilful culling of such pleasures as circumstances afforded from moment to moment, undisturbed by passion, prejudices or superstition, that he conceived the quality of wisdom to be exhibited; and tradition represents him as realizing this ideal to an impressive degree. Among the prejudices from which the wise man was free he included all regard to customary morality beyond what was due to the actual penalties attached to its violation; though he held, with Socrates, that these penalties actually render conformity reasonable. Thus early in the history of ethical theory appeared the most thoroughgoing exposition of hedonism.

Far otherwise was the Socratic spirit understood by Antisthenes and the Cynics (q.v.). They equally held that no speculative research was needed for the discovery of good and virtue, and maintained that the Socratic wisdom was attainable, not in the skilful pursuit, but in the rational disregard of pleasure,—in the clear apprehension of the intrinsic worthlessness of this and most other objects of men’s ordinary desires and aims. Pleasure, indeed, Antisthenes declared roundly to be an evil; “Better madness than a surrender to pleasure.” He did not overlook the need of supplementing merely intellectual insight by “Socratic force of soul”; but it seemed to him that, by insight and self-mastery combined, an absolute spiritual independence might be attained which left nothing wanting for perfect well-being (see also DIogenes). For as for poverty, painful toil, disrespect, and such evils as men dread most, these, he argued, were positively useful as means of progress in spiritual freedom and virtue. There is, however, in the Cynic notion of wisdom, no positive criterion beyond the mere negation of irrational desires and prejudices. We saw that Socrates, while not claiming to have found the abstract theory of good or wise conduct, practically understood by it the faithful performance of customary duties, maintaining that, in that his own happiness was therewith bound up. The Cynics more boldly discarded both pleasure and mere custom as alike irrational; but in so doing they left the freed reason with no definite aim but its own freedom. It is absurd, as Plato urged, to say that knowledge is the good, and then when asked “knowledge of what?” to have no positive reply but “of the good”; but the Cynics do not seem to have made any serious effort to escape from this absurdity.

The ultimate views of these two Socratic schools we shall have to notice presently when we come to the post-Aristotelian schools. We must now proceed to trace the fuller development of the Socratic theory in the hands of Plato and Aristotle.

The ethics of Plato cannot properly be treated as a finished result, but rather as a continual movement from the position of Socrates towards the more complete, articulate system of Aristotle; except that there are ascetic and mystical suggestions in some parts of Plato’s teaching which find no counterpart in Aristotle, and in fact disappear from Greek philosophy soon after Plato’s death until they are revived and fantastically developed in Neoplatonism and Neoplatonism. The first stage at which we can distinguish Plato’s ethical view from that of Socrates is presented in the Protagoras, where he makes a serious, though clearly tentative effort, to define the object of that knowledge which he with his master regards as the essence of all virtue. Such knowledge, he here maintains, is really mensuration of pleasures and pains, whereby the wise man avoids those mistakes under-estimates of future feelings in comparison with present which we commonly call yielding to fear or desire.” This hedonism has perplexed Plato’s readers needlessly (as we have said in speaking of the Cynics) for the extreme asceticism of Neo-Platonism is the most obvious corollary of the Socratic doctrine that the different common notions of good—the beautiful, the pleasant and the useful—were to be somehow interpreted by each other. By Plato, however, this conclusion could have been held only before he had accomplished the movement of thought by which he carried the Socratic method beyond the range of human conduct and developed it into a metaphysical system.

This movement may be expressed thus: “If we know,” said Socrates, “what justice is, we can give an account or definition of it”; true knowledge must be knowledge of the general fact, common to all the individual cases to which we apply our general notion. But this must be no less true of other objects of thought and discourse; the same relation of general notions to particular examples extends through the whole physical universe; we can think and talk of it only by means of such notions. True or scientific knowledge then must be general knowledge, relating, not to individuals primarily, but to the general facts or qualities which individuals exemplify; in fact, our notion of an individual, when examined, is found to be an aggregate of such general qualities. But, again, the object of true knowledge must be what really exists; hence the reality of the universe must lie in general facts or relations, and not in the individuals that exemplify them.

To far the steps are plain enough; but we do not yet see how this logical Realism (as it was afterwards called) comes to have the essentially ethical character that especially interests us in Platonism. Plato’s philosophy is now concerned with the whole universe of being; yet the ultimate object of his philosophic contemplation is still “the good,” now conceived as the ultimate ground of all being and knowledge. That is, the essence of the universe is identified with its end,—the “formal” with the final “cause of things, to use the later Aristotelian phraseology. How comes this about?

Perhaps we may best explain this by recurring to the original application of the Socratic method to human affairs. Since all rational activity is for some end, the different arts or functions of human industry are naturally defined by a statement of their ends or uses; and similarly, in giving an account of the different artists and functionaries, we necessarily state their end, “what they are good for.” In a society well ordered on Socratic principles, every human act must emerge from the use; the very end of his life would consist in doing what he was good for (his proper ἐγγύω). But again, it is easy to extend this view throughout the whole region of organized life; an eye that does not attain its end by seeing is without the essence of an eye. In short, we may say of all organs and instruments that they are what we think them in proportion as they fulfill their function and attain their end. If, then, we conceive the whole universe organically, as a complex arrangement of means to ends, we shall
ETHICS

813

understand how Plato might hold that all things really were, or
(as we say) "realized their idea," in proportion as they accom-
plished the special end or good for which they were adapted. 
Even Socrates, in spite of his aversion to physics, was led by
pious reflection to a reverence coming of the holy things of the
world, as ordered in all its parts by divine wisdom for the realiza-
tion of some divine end; and, in the metaphysical turn which 
Plato gave to this view, he was probably anticipated by Euclid of 
Megara, who held that the one real being is "that which we call
by many names, Good, Wisdom, Reason or God," to which
Plato, raising to a loftier significance the Socratic identification
of the beautiful with the useful, added the further name of
Aesthetic Beauty; reassuring him that a love of the beautiful
finally reveals itself as the yearning for the end and essence of
being.

Plato, therefore, took this vast stride of thought, and identified
the ultimate notions of ethics and ontology. We have now to see
what attitude he will adopt towards the practical inquiries from
which he started. What will now be his view of wisdom, virtue,
pleasure and their relation to human well-being?

The answer to this question is inevitably somewhat com-
plicated. In the first place we have to observe that philosophy
has now passed definitely from the market-place into the lecture-
room. The quest of Socrates was for the true art of conduct for
a man living a practical life among his fellows. But if the objects
of abstract thought constitute the real world, of which this world
of individual things is but a shadow, it is plain that the highest,
most real life must lie in the former region and not in the latter.
It is in contemplating the abstract reality which concrete things
obviously exhibit, the type or ideal which they imperfectly
imitate, that the true life of the mind in man must consist; and
as man is most truly man in proportion as he is mind, the desire
of one's own good, which Plato, following Socrates, held to be
permanent and essential in every living thing, becomes in its
highest form the philosophic yearning for knowledge. This
yearning, he held, springs—like more sensual impulses—from a
sense of want of something formerly possessed, of which there
remains a latent memory in the soul, strong in proportion to its
philosophic capacity; hence it is that in learning any abstract
truth by scientific demonstration we merely make explicit what we
already implicitly know; we bring into clear consciousness hidden
memories of a state in which the soul looked upon Reality and
Good face to face, before the lapse that imprisoned him in an alien
body and mingled her true nature with fleshy feelings and
impulses. We thus reach the paradox that the true art of living
is really an "art of dying" as far as possible to lose the sense of the
imperfect, in order more fully to exist in intimate union with absolute
good and beauty. On the other hand, since the philosopher must still
live and act in the concrete sensible world, the Socratic identifica-
tion of wisdom and virtue is fully maintained by Plato. Only
he who apprehends good in the abstract can imitate it in such
transient and imperfect good as may be realized in human life,
and it is impossible that, having this knowledge, he should not
act on it, whether in private or public affairs. Thus, in the true
philosopher, we shall necessarily find the practically good,
who being "likest of men to the gods is best loved by them ";
and also the perfect statesman, if only the conditions of his
society allow him a sphere for exercising his statesmanship.

The characteristics of this practical goodness in Plato's
matured thought correspond to the fundamental conceptions in
his view of the universe. The soul of man, in its good or
normal condition, must be ordered and harmonized under the guidance of reason. The question then arises,
"Wherein does this order or harmony precisely consist?"
In explaining how Plato was led to answer this question, it will
be well to notice that, while faithfully maintaining the Socratic
doctrine that the highest virtue was inseparable from knowledge
of the good, he had come to recognize an inferior kind of virtue,
possessed by men who were not philosophers. It is plain that
if the good that is to be known is the ultimate ground of the whole
of things, it is attainable only by a select and carefully trained
few. Yet we can hardly restrict all virtue to these alone. What
account, then, was to be given of ordinary "civic" bravery,
temperance and justice? It seemed clear that men who did
their duty, resisting the seductions of fear and desire, must have
right opinions, if not knowledge, as to the good and evil in human
affairs; but it was not to be supposed that this was the kind of
prudence to which the Socratic virtues are applied; on the contrary,
said, it comes by nature and "divine allotment," but for its
adequate development "custom and practice" are required.
Hence the paramount importance of education and discipline
for civic virtue; and even for future philosophers such moral
culture, in which physical and aesthetic training must co-operate,
is indispensable; no merely intellectual preparation will suffice.

His point is that perfect knowledge cannot be implanted in a
man until he has not only the love of the beautiful but the beautiful
itself; it is not a question of a mere habit of thought; it is a
matter of an actual understanding. What, then, is this prepara-
tion? A distinct step in psychological analysis was taken when
Plato recognized that its effect was to produce the "harmony" 
above mentioned among different parts of the soul, by sub-
ordinating the impulsive elements to reason. These non-rational
elements he further distinguished as appetitive (τὸ πρόθυμον)
and spirited (τὸ θυμωδές or θυμός)—the practical separate-
sens of which from each other and from reason he held to be
established by our inner experience.

On this triple division of the soul he founded a systematic
view of the four kinds of goodness recognized by the common
moral consciousness of Greece, and in later times known as the
Cardinal Virtues (ἡ πρεσβεία). Of these the two most fundamental
were (as has been already indicated) wisdom—in its highest form
philosophy—and that harmonious and regulated activity of all
the elements of the soul which Plato regarded as the essence of
morality in social relations (παράστασις). The import of
this term is essentially social; and we can explain Plato's use of
it only by reference to the analogy which he drew between
the individual man and the community. In a rightly ordered
polity social and individual well-being alike depend on that
harmonious action of diverse elements, each performing its proper
function, which in its social application is more naturally termed
παράστασις. We see, moreover, how in Plato's view the funda-
mental virtues, Wisdom and Justice in their highest forms, are
mutually involved. Wisdom will necessarily maintain orderly
activity, and this latter consists in regulation by wisdom, while
the two more special virtues of Courage (δραπέτης) and Temper-
ance (σωφροσύνη) are only different sides or aspects of this wisely
regulated action of the complex soul.

Such, then, are the forms in which essential good seemed to
manifest itself in human life. It remains to ask whether the
statement of these conceptions gives a complete account of human well-being, or whether pleasure also is to be included. On this point Plato's
view seems to have gone through several oscillations. After
apparently maintaining (Protagoras) that pleasure is the good,
he passes first to the opposite extreme, and denies it (Phaedo,
Gorgias) to be a good at all. For (1), as concrete and transient,
it is obviously not the real essential good that the philosopher
seeks; (2) the feelings most prominently recognized as pleasures
are bound up with pain, as good can never be with evil; in so far,
then, as common sense rightly recognizes some pleasures, good,
it can only be from their tendency to produce some further good.
This view, however, was too violent a divergence from Socra
ticism for Plato to remain in it. That pleasure is not the real absolute
good, was no ground for not including it in the good of concrete
human life; and after all only coarse and vulgar pleasures were
indissolubly linked to the pains of want. Accordingly, in the
Republic he has no objection to trying the question of the intrinsic
superiority of philosophic or virtuous life by the standard of
pleasure, and argues that the philosophic (or good) man alone
enjoys real pleasure, while the sensualist spends his life in oscillat-
ing between painful want and the merely neutral state of pain-
lessness, which he mistakes for positive pleasure. Still more

1 It is highly characteristic of Platonism that the issue in this
dialogue, as originally stated, is between virtue and vice, whereas,
without any avowed change of ground, the issue ultimately discussed
is between the philosophic life and the life of vulgar ambition or
sensual enjoyment.
emphatically it is declared in the Laws that when we are "dis-
couraging to men, not to gods," we must show that the life which we
praise as best and noblest is also that in which there is the
purest and most superior pleasure. But though Plato
holds this inseparable connection of best and pleasantest to be
true and important, it is only for the sake of the vulgar that he
lays this stress on pleasure. For in the most philosophical com-
parison in the Philebus between the claims of pleasure and wisdom
the former is altogether worsted; and though a place is allowed to
the pure pleasures of colour, form and sound, and of intellectual
exercise, and even to the "necessary" satisfaction of appetite,
it is only a subordinate one. At the same time, in his later view
Plato avoids the exaggeration of denying all positive quality of
pleasure even to the coarser sensual gratifications; they are un-
doubtedly cases of "replenishment" or "restoration" to its "natural
state" of a bodily organ, in which he defines pleasure to consist
(see Timaeus, pp. 64, 65); he merely maintains that the common estimate of them is to a large extent illusory, or a false
appearance of pleasure is produced by contrast with the ante-
cescent or concomitant painful condition of the organ. It is not
surprising that this somewhat complicated and delicately balanced
view of the relations of "good" and "pleasure" was not long
maintained within the Platonic school, and that under Speusippus,
Plato's successor, the main body of Platonists took up a simply
anti-hedonistic position, as we learn from the polemic of Aristotle.
In the Philebus, however, though a more careful psychological
analysis leads him to soften down the exaggerations of this attack
on sensual pleasures, the antithesis knowledge and pleasure is
again sharpened, and a desire to degrade even good pleasures
is more strongly shown; still even here pleasure is recognized
as a constituent of that philosophic life which is the highest
human good, while in the Laws, where the subject is more
popularly treated, it is admitted that we cannot convince man
that the just life is the best unless we can also prove it to be the
pleasants.

When a student passes from Plato to Aristotle, he is so
forcibly impressed by the contrast between the habits of
mind of the two authors, and the literary manners
of the two philosophers, that it is easy to under-
stand how their systems have come to be popularly
conceived as diametrically opposed to each other; and the
uncompromising polemic which Aristotle, both in his ethical
and in his metaphysical treatises, directs against Plato and
the platonists, has tended strongly to confirm this view. Yet
a closer inspection shows us that while the early speculative
philosophy of the Academy (Antiochus of Ascalon) repudiated the scepticism which
for two hundred years had been accepted as the traditional
Platonic doctrine, he had good grounds for claiming Plato and
Aristotle as consentient authorities for the ethical position which
he took up. For though Aristotle's divergence from Plato is
very conspicuous when we consider either his general concep-
tion of the subject of ethics, or the details of his system of virtues,
still his agreement with his master is almost complete as regards
the main outline of his theory of human good; the difference
between the two practically vanishes when we view them in
relation to the later controversy between Stoics and Epicureans.
Even on the cardinal point on which Aristotle entered into direct
controversy with Plato, the definite disagreement between the
two is less than at first appears; the objections of the disciples
hit that part of the master's system that was rather imagined
than thought; the main positive result of Platonic speculation
only gains in distinctness by the application of Aristotelian
analysis.

Plato, we saw, held that there is one supreme science
or wisdom, of which the ultimate object is absolute good;
in the knowledge of this, the knowledge of all particular
goods—that is, of all that we rationally desire to know—is
implicitly contained; and also all practical virtue, as no one
who truly knows what is good can fail to realize it. But in spite
of the intense conviction with which he thus identified meta-
physical speculation and practical wisdom, we find in his writings
no serious attempt to deduce the particulars of human well-being
from his knowledge of absolute good, still less to unfold from it
the particular cognitions of the special arts and sciences. Indeed,
we may say that the distinction which Aristotle explicitly draws
between speculative wisdom and practical wisdom (on its political side statesmanship) is really indicated in Plato's
actual treatment of the subjects, although the express recognition
of it is contrary to his principles. The discussion of good (e.g.)
in his Philebus relates entirely to human good, and the respective
claims of Thought and Pleasure to constitute this; he only refers
in passing to the Divine Thought that is the good of the ordered
world, as something clearly beyond the limits of the present
discussion. So again, in his last great ethico-political treatise
(three Laws) there is hardly a trace of his peculiar metaphysics.
On the other hand, the relation between human and divine
good, as presented by Aristotle, is so close that we can hardly
conceive Plato as having definitely thought it closer. The
substantial good of the universe, in Aristotle's view, is the pure
activity of universal abstract thought, at once subject and object,
which, itself changeless and eternal, is the final cause and first
source of the whole process of change in the concrete world. And
both he and Plato hold that a similar activity of pure speculative
intellect is that in which the philosopher will seek to exist,
though he must, being a man, concern himself with the affairs
of ordinary human life, a region in which his highest good will
be attained by realizing perfect moral excellence. No doubt
Aristotle's demonstration of the inappropriateness of attributing
moral excellence to the Deity seems to contradict Plato's doctrine
that the just man as such is "likest the gods;" but here again
the discrepancy is reduced when we remember that the essence
of Plato's justice (benevolence) is harmonious activity. No doubt,
too, Aristotle's attribution of pleasure to the Divine Existence
shows a profound metaphysical divergence from Plato; but it is
a divergence which has no practical importance. Nor, again,
is Aristotle's divergence from the Socratic principle that all
virtue is knowledge "substantially greater than Plato's, though
it is more plainly expressed. Both accept the paradox in the
qualified sense that no one can deliberately act contrary to what
appears to him good, and that perfect virtue is inseparably bound
up with perfect wisdom or moral insight. Both, however, recog-
nize that this actuality of moral insight is not a function of the
intellect only, but depends rather on careful training in good
habits applied to minds of good natural dispositions, though the
discipline has no doubt a more definite and prominent place
in Aristotle's system. The disciple certainly takes a step in advance
by acknowledging explicitly, as an essential characteristic of virtuous
attitude or action, that it is chosen for its own sake, for the beauty of virtue
alone; but herein he merely formulates the conviction that his
master inspires. Nor, finally, does Aristotle's account of the rela-
tion of pleasure to human well-being (although he has to combat
the extreme anti-hedonism to which the Platonic school under
Speusippus had been led) differ materially from the outcome
of Plato's thought on this point, as the later dialogues present it to us.
Pleasure, in Aristotle's view, is not the primary constituent
of well-being, but rather an inseparable accident of it; human
well-being is essentially well-doing, excellent activity of some
kind, whether its aim and end be abstract truth or noble conduct;
knowledge and virtue are objects of rational choice apart from
the pleasure attending them; still all activities are attended and
in a manner perfected by pleasure, which is better and more
desirable in proportion to the excellence of the activity. He no
doubt criticizes Plato's account of the nature of pleasure, arguing
that we cannot properly conceive pleasure either as a "process"
or as "replenishment"—the last term, he truly says, denotes a
material rather than a psychical fact. But this does not interfere
with the general ethical agreement between the two thinkers;
and the doctrine that vicious pleasures are not true or real
pleasures is so characteristically Platonic that we are almost
surprised to find it in Aristotle.

In so far as there is any important difference between
the Platonic and the Aristotelian views of human good, we may
observe that the latter has substantially a closer correspon-
dence to the positive element in the ethical teaching of Socrates,
though it is presented in a far more technical and scholastic form, and involves a more distinct rejection of the fundamental Socratic paradox. The same result appears when we consider the method of the three philosophers. Although the Socratic induction forms a striking feature of Plato's dialogues, his ideal method of ethics is purely deductive; he admits common sense only as supplying provisional steps and starting-points from which the mind is to ascend to knowledge of absolute good, through which knowledge alone, as he conceives, the lower notions of particular goods are to be truly conceived. Aristotle, discarding the transcendentalism of Plato, naturally retained from Plato's teaching the original Socratic method of induction from and verification by common opinion. Indeed, the windings of his exposition are best-understood if we consider his literary manner as a kind of Socratic dialogue formalized and reduced to a monologue. He first leads us by an induction to the fundamental notion of ultimate end or good for man. All men, in acting, aim at some result, either for its own sake or as a means to some further end; but obviously not everything can be sought merely as a means; there must be some ultimate end. In fact men commonly recognize such an end, and agree to call it well-being (εὐονομία). But they take very different views of its nature; how shall we find the true view? We observe that men are classified according to their functions; all kinds of man, and indeed all organs of man, have their special functions, and are judged as functionaries and organs according as they perform their functions well or ill. May we not then infer that man, as has his proper function, the well-being or εὐονομία. All seek really lies in fulfilling well the proper function of man,—that is, in living well the life of the rational soul which we recognize as man's distinctive attribute?

Again, this Socratic deference to common opinion is not shown merely in the way by which Aristotle reaches his fundamental conception; it equally appears in his treatment of the conception itself. In the first place, though in Aristotle's view the most perfect well-being or εὐονομία was, and has been, not what we should call common happiness, it is inseparably connected with such functioning. Even when the notion of "good performance of function" was the most general, and when it had further taken on the pleasure that is inseparably connected with such functioning, it did not yet correspond to the whole of what a Greek commonly understood as "human well-being." We may grant, indeed, that a moderate provision of material wealth is indirectly included, as an indispensable pre-requisite of a due performance of many functions as Aristotle conceives it—his system admits of no beatitudes for the poor; still there remain other goods, such as beauty, good birth, welfare of progeny, the presence or absence of which influenced the common view of a man's well-being, though they could hardly be shown to be even indirectly important to his "well-acting." These Aristotle attempts neither to exclude from the philosophic conception of well-being nor to include in his formal definition of it. The deliberate looseness which is thus given to his fundamental doctrine characterizes more or less his whole discussion of ethics. He plainly says that the subject does not admit of completely scientific treatment; his aim is to give not a definite theory of human good, but a practically adequate account of its most important constituents.

The most important element, then, of well-being or good life for ordinary men Aristotle holds to consist in well-doing as determined by the notions of the different moral excellences.

In expounding these, he gives throughout the pure result of analytical observation of the common moral consciousness of his age. Ethical truth, in his view, is to be attained by careful comparison of the partial philosophical opinions on which moral truth is to be obtained by induction from particular physical observations. On account of the conflict of opinion in ethics we cannot hope to obtain certainty upon all questions; still reflection will lead us to discard some of the conflicting views and find a reconciliation for others, and will furnish, on the whole, a practically sufficient residuum of moral truth. This adhesion to common sense, though it involves a sacrifice of both depth and completeness in Aristotle's system, gives at the same time an historical interest which renders it deserving of special attention as an analysis of the current Greek ideal of "fair and good life" (ἀρετής καὶ ἀληθής). His virtues are not arranged on any clear philosophic plan; the list shows no serious attempt to consider human life exhaustively, and exhibit the standard of excellence appropriate to its different departments or aspects. He seems to have taken as a starting-point Plato's four cardinal virtues. The two comprehensive notions of Wisdom and Justice (σοφία καὶ ἄρετος) he treats separately. As regards both his analysis leads him to diverge considerably from Plato. As we saw, his distinction between practical and speculative Wisdom belongs to the deepest of his disagreements with his master; and in the case of ἀρετής again he distinguishes the wider use of the term to express Law-observance, which (he says) coincides with the social side of virtue generally, and its narrower use for the virtue that aims at a kind of equality, whether (1) in the distribution of wealth, honour, &c., or (2) in commercial exchange, or (3) in the reparation of wrong done. Then, in arranging the other special virtues, he begins with courage and temperance, which (after Plato) he considers as the excellences of the "irrational element" of the soul. Next follow two pairs of excellences, concerned respectively with wealth and honour: (1) liberality and magnificence, of which the latter is exhibited in greater matters of expenditure, and (2) laudable ambition and high-mindedness. Then comes gentleness—the virtue regulative of anger; and the list is concluded by the excellences of social intercourse, friendliness (as a mean between obsequiousness and surliness), truthfulness and decorum.

The abundant store of just and close analytical observation contained in Aristotle's account of these notions gives it a permanent interest, even beyond its historical value as a delineation of the Greek ideal of "fair and good life." But its looseness of arrangement and almost grotesque co-ordination of widely differing in importance are obvious. Thus his famous general formula for virtue, that it is a mean or middle state, always to be found somewhere between the vices which stand to it in the relation of excess and defect, scarcely avails to render his treatment more systematic. It was important, no doubt, to express the need of observing due measure and proportion, in order to attain good results in human life no less than in artistic products; but the observation of this need was no new thing in Greek literature; indeed, it had already led the Pythagoreans and Plato to find the ultimate essence of the ordered universe in number. But Aristotle's purely quantitative statement of the relation of virtue and vice is misleading, even where it is not obviously inappropriate; and sometimes leads him to such eccentricities as that of making simple veracity a mean between boastfulness and mock-modesty. 4

1 This cardinal term is commonly translated "happiness"; and it must be allowed that it is the most natural term for what (in English) agree to call "our being's end aim." But happiness so definitely signifies a state of feeling that it will not admit the interpretation that Aristotle (as well as Plato and the Stoics) expressly gives to εὐονομία; the confusion is best avoided by rendering the word by the less familiar "well-being."
It ought to be said that Aristotle does not present the formula just discussed as supplying a criterion of good conduct in any particular case; he expressly leaves this to be determined by *"...the judgment of the prudent man (δφρονίμος)".* We cannot, however, find that he has furnished any substantial principles for its determination; indeed, he hardly seems to have formed a distinct general idea of the practical syllogism by which he conceives it to be effected. 1 The kind of reasoning which his view of virtuous conduct requires is one in which the ultimate major premise states a distinctive characteristic of some virtue, and one or more minor premises show that such characteristic belongs to a certain mode of conduct under given circumstances; since it is essential to good conduct that it should contain its end in itself, and be chosen for its own sake. But he has not failed to observe that practical reasonings are not commonly of this kind, but are rather concerned with actions as means to ulterior ends; indeed, he lays stress on this as a characteristic of the "political" life, when he wishes to prove its inferiority to the life of pure speculation. Though common sense will admit that virtues are the best of goods, it still undoubtedly conceives practical wisdom as chiefly exercised in providing those inferior goods which Aristotle, after recognizing the need or use of them for the realization of human well-being, has dropped out of sight; and the result is that, in trying to make clear his conception of practical wisdom, we find ourselves fluctuating continually between the common notion, which he does not distinctly reject, and the notion required as the basis of his ethical system. 2

On the whole, there is probably no treatise so masterly as Aristotle's *Ethics*, and containing so much close and valid thought, that yet leaves on the reader's mind so strong an impression of dispersive and incomplete work. It is only by dwelling on these defects that we can understand the small amount of influence that his system exercised during the five centuries after his death, as compared with the effect which it has had directly or indirectly, in shaping the thought of modern Europe. Partly, no doubt, the limited influence of his disciples, the Peripatetics (q.v.), is to be attributed to that exaltation of the purely speculative life which distinguished the Aristotelian ethics from other later systems, and which was too alien from the common moral consciousness to find much acceptance in an age in which the ethical aims of philosophy had again become paramount. Partly, again, the analytical distinctness of Aristotle's manner brings into special prominence the difficulties that attend the systematic effort to reconcile the ideal aspirations of men with the principles on which their practical reasonings are commonly conducted. The conflict between these two elements of Common Sense was too profound to be compromised; and the moral consciousness of mankind demanded a more trenchant partisanship than Aristotle's. Its demands were met by the Stoic school which separated the moral from the worldly view of life, with an absoluteness and definiteness that caught the imagination; which regarded practical goodness as the highest manifestation of its ideal of wisdom; and which bound the common notions of duty into an apparently coherent system, by a formula that comprehended the whole of human life, and exhibited its relation to the ordered process of the universe. The intellectual descent of its ethical doctrines is principally to be traced to Socrates through the Cynics, though an important element in them seems attributable to the school that inherited the "Academy" of Plato. Both Stoic and Cynic maintained, in its sharpest form, the fundamental tenet that the practical knowledge which is virtue, with the condition of soul that is inseparable from it, is alone to be accounted good. He who exercises this wisdom or knowledge has complete well-being; all else is indifferent to him. It is true that the Cynics were more concerned to emphasize the negative side of the sage's well-being, while the Stoics brought into more prominence its positive side. This difference, however, was most important for it was the knowledge of the *Stoics* in fact, seem generally to have regarded the eccentricities of Cynicism as an emphatic manner of expressing the essential antithesis between philosophy and the world; a manner which, though not necessary or even normal, might yet be advantageously adopted by the sage under certain circumstances. 3

Wherein, then, consists this knowledge or wisdom that makes free and perfect? Both Cynics and Stoics (q.v.) agreed that the most important part of it was the knowledge of the *good* moral man in this knowledge or wisdom itself. It must be understood that by wisdom they meant wisdom realized in act; indeed, they did not conceive the existence of wisdom as separable from such realization. We may observe, too, that the Stoics rejected the divergence which we have seen gradually taking place in Platonic-Aristotelian thought from the position of Socrates, that no one aims at what he knows to be bad. 4 The stress that their psychology laid on the essential unity of the rational self that is the source of voluntary action prevented them from accepting Plato's analysis of the soul into a regulative element and elements needing regulation. They held that what we call passion is a morbid condition of the rational soul, involving erroneous judgment as to what is to be sought or shunned. From such passionate errors the truly wise man will of course be free. He is conscious indeed of physical appetitions, but he will not be misled into supposing that its object is really good; he cannot, therefore, hope for the attainment of this object or fear to miss it, as these states involve the conception of it as a good. Similarly, though like other men he will be subject to bodily pain, this will not cause him mental grief or disquiet, as his worst agonies will not disturb his clear conviction that it is really indifferent to his true reasonable self.

That this impulsive sage was a being not to be found among living men the later Stoics at least were fully aware. They faintly suggested that one or two moral heroes of old time might have realized the ideal, but they admitted that all other philosophers (even) were merely in a state of progress towards it. This admission did not in the least diminish the rigour of their demand for absolute loyalty to the exclusive claims of wisdom. The assurance of its own unique value that such wisdom involved they held to be an abiding possession for those who had attained it 5 and without this no act could be truly wise or virtuous. Whatever was not of knowledge was of sin; and the distinction between right and wrong being absolute and not admitting of degrees all sins were equally sinful; whoever broke the least commandment was guilty of the whole law. Similarly, all wisdom was somehow involved in any one of the manifestations of wisdom, commonly distinguished as particular virtues; though whether these virtues were specifically distinct, or only the same knowledge in different relations, was a subtle question on which the Stoics do not seem to have been agreed.

Aristotle had already been led to attempt a refutation of the Socratic identification of virtue with knowledge; but his attempt had only shown the profound difficulty of attacking the paradox, so long as it was admitted that no one could of deliberate purpose act contrary to what seemed to him best. Now, Aristotle's divergence from Socrates had not led him so far as to deny this; while for the Stoics who had preceded to the original Socratic position, the difficulty was still more patent. This theory of virtue led them into two dilemmas. Firstly, if virtue is knowledge, does it follow that vice is involuntary? If not, it must be that ignorance is voluntary. This alternative is the less dangerous to morality, and as such the Stoics chose it. But they were

---

1 There is a certain difficulty in discussing Aristotle's views on the subject of practical wisdom, and the relation of the intellect to moral action, since it is most probable that the only accounts that we have of these views are not part of the genuine writings of Aristotle. Still books vi. and vii. of the *Nicomachean Ethics* contain no doubt as pure Aristotelian doctrine a disciple could give, and appear to have been insufficient for the general criticism expressed in the text.
not yet at the end of their perplexities; for while they were thus driven to an extreme extension of the range of human volition, their view of the physical universe involved an equally thorough-going tenets of the Stoic school: who would the wise man be responsible if his vice were strictly pre-determined? The Stoics answered that the error which was the essence of vice was so far voluntary that it could be avoided if men chose to exercise their reason. No doubt it depended on the innate force and firmness of a man’s soul whether his reason was effectively exercised; but moral responsibility was saved if the vicious act proceeded from the man himself and not from any external cause.

With all this we have not ascertained the positive practical content of this wisdom. How are we to emerge from the barren circle of affirming (1) that wisdom is the sole good and unwisdom the sole evil, and (2) that wisdom is the knowledge of good and evil; and attain some method for determining the particular acts of good conduct? The Cytics made no attempt to solve this difficulty; they were content to mean by virtue what any plain man meant by it, except in so far as their sense of independence led them to reject certain received precepts and prejudices. The Stoics, on the other hand, not only worked out a detailed system of duties—or, as they termed them, “things meet and fit” (kath' hoira) for all occasions of life; they were further especially concerned to comprehend them under a general formula. They found this by bringing out the positive significance of the notion of Nature, which the Cynic had used chiefly in a negative way, as an antithesis to the “consensus dei” (10), from which his knowledge had made him free. Even in this negative use of the notion it is necessarily implied that whatever active tendencies in man are found to be “natural” — that is, independent of and uncorrupted by social customs and conventions—will properly take effect in outward acts, but the adoption of “conformity to nature” as a general positive rule for outward conduct seems to have been due to the influence on Zeno of Academic teaching. Whence, however, can this authority belong to the natural, unless nature be itself an expression or embodiment of divine law and wisdom? The conception of the world, as organized and filled by divine thought, was common, in some form, to all the philosophies that looked back to Socrates as their founder,—some even maintaining that this thought was the sole reality. This pantheistic doctrine harmonized thoroughly with the Stoic view of human good; but being unable to conceive substance ideally, they (with considerable aid from the system of Heraclitus) supplied a practical side to their pantheistic notion of divine thought as an attribute of the purest and most primary of material substances, a subtle fiery aether. This theological view of the physical universe had a double effect on the ethics of the Stoic. In the first place it gave to his cardinal conviction of the all-sufficiency of wisdom for human well-being a root of cosmical fact, and an atmosphere of religious and social emotion. The exercise of wisdom was now viewed as the pure life of that particle of divine substance which was in very truth the “god within him”; the reason whose supremacy he maintained was the reason of Zeus, and of all gods and reasonable men, no less than his own; its realization in any one individual was thus the common good of all rational beings as such; “the sage could not stretch out a finger rightly without thereby benefiting all other sages,” —nay, it might even be said that he was “as useful to Zeus as Zeus to him.” But again, the same conception served to harmonize the higher and the lower elements of human life. For even in the physical or non-rational man, as originally constituted, we may see clear indications of the divine design, which it belongs to his rational will to carry into conscious execution; indeed, in the first stage of human life, before reason is fully developed, uncorrupted natural impulse effects what is afterwards the work of reason. Thus the formula of “living according to nature,” in its application to man as the “rational animal,”

1 Hence some members of the school, without rejecting the definition of virtue = knowledge, also defined it as “strength and force.”

2 It is apparently in view of this union in reason of rational beings that it is supposed to be “extraverted” to the sage, and that the possession of good children is also counted a good.

may be understood both as directing that reason is to govern, and as indicating how that government is to be practically exercised. In man, as in every other animal, from the moment of its natural impulse prompts to the maintenance of its physical frame; then, when reason has been developed and has recognized itself as its own sole good, these “primary ends of nature” and whatever promotes these still constitute the outward objects at which reason is to aim; there is a certain value (ádēs) in them, in proportion to which they are “preferred” (προτείνεται) and their opposites “rejected” (ἀντιπροτείνεται); indeed it is only in the due and consistent exercise of such choice that wisdom can find its practical manifestation. In this way all or most of the things commonly judged to be “goods”—health, strength, wealth, fame,—are brought within the sphere of the sage’s choice, though his real good is solely in the wisdom of the choice, and not in the thing chosen.

The doctrine of conformity to Nature as the rule of conduct was not peculiar to Stoicism. It is found in the theories of Sperusippus, Xenocrates, and also to some extent in those of the Peripatetics. The peculiarity of the Stoics lay in their refusing to use the terms “good and evil” in connexion with “things indifferent,” and in pointing out that philosophers, though independent of these things, must yet deal with them in practical life.

So far we have considered the “nature” of the individual man as apart from his social relations; but the sphere of virtue, as commonly conceived, lies chiefly in these, and this was fully recognized in the Stoic account of duties (kath' hoira); indeed, in their exposition of the “natural” basis of justice, the evidence that man was born not for himself but for mankind is the most important part of their work in the region of practical morality. Here, however, we especially notice the double significance of “natural,” as applied to (1) what actually exists everywhere for the most part, and (2) what would exist if the original plan of man’s life were fully carried out; and we find that the Stoics have not clearly harmonized the two elements of the notion. That man was “naturally” a social animal Aristotle had already taught; that all rational beings, in the unity of the reason that is common to all, form naturally one community with a common law was (as we saw) an immediate inference from the Stoic conception of the universe as a whole. That the members of this “city of Zeus” should observe their contracts, abstain from mutual harm, combine to protect each other from injury, were obvious points of natural law; while again, it was clearly necessary to the preservation of human society that its members should form sexual unions, produce children, and bestow care on their rearing and training. But beyond this nature did not seem to go in determining the relations of the sexes; accordingly, we find that community of wives was a feature of Zeno’s ideal commonwealth, just as it was of Plato’s; while, again, the strict theory of the school recognized no government or laws as true or binding except those of the sage; he alone is the true ruler, the true king. So far, the Stoic “nature” seems in danger of being as revolutionary as Rousseau’s. Practically, however, this revolutionary aspect of the notion was kept for the most part in the background; the rational law of an ideal community was not distinguished from the positive ordainances and customs of actual society; and the “natural” ties that actually bound each man to family, kinship, fatherland, and to unwise humanity generally, supplied the outline on which the external manifestation of justice was delineated. It was a fundamental maxim that the sage was to take part in public life; and it does not appear that his political action was to be regulated by any other principles than those commonly accepted in his community.

Similarly, in the view taken by the Stoics of the duties of social decorum, and in their attitude to the popular religion, we find a fluctuating compromise between the disposition to repudiate what is conventional, and the disposition to revere what is conventional; and the same would be true of the most outside of the sage’s circle, as for instance the husband and wife. The Stoics seem to have varied in their view of “good repute,” ádēs; at first, when the school was more under the influence of Cynicism, they professed an outward as well as an inward indifference to all things extraneous to the moral life. Ultimately they conceived the point to common sense, and included it among προτείνεται.
established, each tendency expressing in its own way the principle of "conforming to nature." Stokes and hedonists.

Skepticism. In the fundamental principle of his philosophy Epicurus is not original. Aristotle (cf. also Plato in the Protagoras) had already recognized that the sole ultimate good, and the sole evil; that no pleasure is to be rejected except for its painful consequences, and no pain to be chosen except as a means to greater pleasure; that the stringency of all laws and customs depends solely on the legal and social penalties attached to their violation; that, in short, all virtuous conduct and all speculative activity are empty and useless, except as contributing to the pleasantness of the agent's life. And Epicurus assures us that he means by pleasure what plain men mean by it; and that if the gratifications of appetite and sense are discarded, the notion is emptied of its significance. So far the system would seem to suit the inclinations of the most thorough-going voluntary.

The originality of Epicurus lay in his theory that the highest point of pleasure, whether in body or mind, is to be attained by the mere removal of pain or disturbance, after which pleasure admits of variation only and not of augmentation; that therefore the utmost gratification of which the body is capable may be provided by the simplest means, and that "natural wealth" is no more than any man can earn. When further he teaches that the attainment of happiness depends almost entirely upon insight and right calculation, fortune having very little to do with it; that the pleasures and pains of the mind are far more important than those of the body, owing to the accumulation of feeling caused by memory and anticipation; and that an indispensable effort to avoid the offensive that consistent egotistic enjoyment and self-sufficing are apt to give to ordinary human feeling. As regards friendship, Epicurus was a man of peculiarly unexclusive sympathies. The genial fellowship of the philosophic community that he collected in his garden remained a striking feature in the traditions of his school; and certainly the ideal which Stokes and Epicureans equally cherished of a brotherhood of sages was most easily realized on the Epicurean plan of withdrawing from the world, and salvation from the endless round of mental and physical changes, and of living a life that consisted in rejection of all superstitions, which can be effected only by a thorough knowledge of the physical universe—he introduces an ample area for the exercise of the philosophic intellect. So again, in the stress that he lays on the misery which the most secret wrong-doing must necessarily cause from the perpetual fear of discovery, and in his exuberant exaltation of the value of disinterested friendship, he shows a sincere, though not completely successful, effort to avoid the offensive that consistent egotistic enjoyment and self-sufficing are apt to give to ordinary human feeling. Later Greek philosophy. Stoicism in Rome.

1 It is noted of him that he did not disdain the co-operation either of women or of slaves in his philosophical labours. The last charge of Epicurus to his disciples is said to have been, τοὺς δογμὰς τουσ ἐκμαθὼν κακοπελεῖ.
on the essentially Greek doctrine which it received.—a reaction all the more inevitable from the very affinity between the Stoic sage and the ancient Roman ideal of manliness. It was natural that the earlier Stoics should be chiefly occupied with delineating the inner and outer characteristics of ideal wisdom and virtue, and that the gap between the ideal sage and the actual philosopher, though never ignored, should yet be somewhat overlooked. But when the question "What is man's good?" had been answered by an exposition of perfect wisdom, the practical question "How may a man emerge from the folly of the world, and get on the way towards it?" naturally attracted attention; and the preponderance of moral over scientific interest, which was characteristic of the Roman mind, gave this question special prominence. The sense of the gap between theory and fact gives to the religious element of Stoicism a new force; the soul, conscious of its weakness, leans on the thought of God, and in the philosopher's attitude towards external events, pious resignation preponderates over self-posessed indifference; the old self-reliance of the reason, looking down on man's natural life as a mere field for its exercise, makes room for a positive aversion to the flesh as an alien element impairing the spirit; the body has come to be a "corpse which the soul sustains"; and life a "sojourn in a strange land"; and in short, the ethical idealism of Zeno has begun to borrow from the metaphysical idealism of Plato.

In no one of these schools was the outward coherence of tradition so maintained by inner changes as it was in Plato's.

The alterations, however, in the metaphysical position of the Academics had little effect on their ethical teaching, as, even during the period of Scepticism, they appear to have presented as probable the same general view of human good which Antiochus afterwards dogmatically announced as a revival of the common doctrine of Plato and Aristotle. And during the period of a century and a half between Antiochus and Plutarch, we may suppose that a conception of natural life and nature, and of the body as we have maintained the old controversy with Stoicism on much the same ground, accepting the formula of "life according to nature," but demanding that the "good" of man should refer to his nature as a whole, the good of his rational part being the chief element, and always preferable in case of conflict, but yet not absolutely his sole good. In Plutarch, however, we see the same tendencies of change that we have noticed in later Stoicism. The Stoic view of the real is definitely maintained, and the lower elements of human life has begun to be disturbed, and the side of Plato's teaching that deals with the inevitable imperfections of the world of concrete experience becomes again prominent. For example, we find Plutarch amplifying the suggestion in Plato's latest treatise (the Law) that this imperfection is due to a bad world-soul that strives against the good,—a suggestion which is alien to the general tenor of Plato's doctrine, and had consequently been unnoticed during the intervening centuries. We observe, again, the value that Plutarch attaches, not merely to the sustainment and consolation of rational religion, but to the supernatural communications vouchsafed by the divinity to certain human beings in dreams, through oracles, or by special warnings, like those of the genius of Socrates. For these flashes of intuition, he holds, the soul should be prepared by tranquil repose and the subjugation of sensuality through abstinence. The same ascetic effort to attain by aloofness from the body a pure receptivity for supernatural influences, is exhibited in Neo-Pythagoreanism. But the general tendency that we are noting did not find its full expression in a reasoned system until we come to the Egyptian Plotinus.

The system of Plotinus (205–270 A.D.) is a striking development of that element of Platonism which has had most fascination for the medieval and even for the modern mind, and yet which had almost vanished out of sight in the controversies of the post-Aristotelian schools. At the same time the differences are the more noteworthy from the reverent adhesion which the Neoplatonists always maintain to Plato. Plato identified good with the real essence of things;

1 Epictetus.

2 Marcus Aurelius.

with that in them which is definitely conceivable and knowable. It belongs to this view to regard the imperfection of things as devoid of real being, and so incapable of being definitely thought or known; accordingly, we find that Plato has no technical term for that in the concrete sensible world which hinders it from perfectly expressing the abstract ideal world, and which in Aristotle's system is distinguished as absolutely formless matter (φύσα). And so, when we pass from the ontology to the ethics of Platonism, we find that, though the highest life is only to be realized by turning away from concrete human affairs and their material environment, still the sensible world is not to be an object of positive moral aversion; it is rather something which the philosopher is seriously concerned to make as harmonious, good and beautiful as possible. But in Neoplatonism the inferiority of the condition in which the embodied human soul finds itself is more intensely and painfully felt; hence an express recognition of formless matter (φύσα) as the "first evil," from which is derived the "second evil," body (φύσα), to whose influence all the evil in the soul's existence is due. Accordingly the ethics of Plotinus represent, we may say, the moral idealism of the Stoics cut loose from nature. The only good of man is the pure existence of the soul, which, in itself, apart from the contagion of the body, is perfectly free from error or defect; if only it can be restored to the untrammeled activity of its original being, nothing external, nothing bodily, can positively impair its personal welfare. It is the lowest form of the "heroic" virtue of Plato's Republic—that is summed up in restraining those animal impulses whose presence in the soul is due to its mixture with the body; higher or philosophic wisdom, temperance, courage and justice are essentially purified from this contagion; until finally the highest mode of goodness is reached, in which the soul has no community with the body, and is entirely turned towards reason. It should be observed that Plotinus himself is still too Platonian to hold that the absolute morality of the real is in any way contingent; and that a virtue is required for purifying the soul; but this ascetic inference was drawn to the fullest extent by his disciple Porphyry.

There is, however, a yet higher point to be reached in the upward ascent of the Neoplatonist from matter; and here the divergence of Plotinus from Platonistic idealism is none the less striking, because it is a bona fide result of reverent reflection on Plato's teaching. The cardinal assumption of Plato's metaphysical morality is that of an ideal body, and a soul is required for purifying the soul; but this ascetic inference was drawn to the fullest extent by his disciple Porphyry.

Neoplatonism, originally Alexandrine, is often regarded as Hellenistic rather than Hellenic, a product of the mingling of Greek with Oriental civilization. But however Oriental may have been the cast of mind that welcomed this theosophic transcendence, the forms of thought by which these views were philosophically reached are essentially Greek; and it is by a thoroughly intelligible process of natural development, in which the intensification of the moral consciousness represented by Stoicism plays an important part, that the Hellenic pursuit of knowledge culminates in a preparation for ecstasy, and the Hellenic idealization of man's natural life ends in a settled antipathy toward the body and its works. At the same time we ought not to overlook the affinities between the doctrine of Plotinus and that remarkable combination of Greek and Hebrew thought which Philo Judaeus had expounded two centuries before; nor the fact that Neoplatonism was developed in
conscious antagonism to the new religion which had spread from Judea, and was already threatening the conquest of the Graeco-Roman world, and also to the Gnostic systems (see Gnosticism); nor, finally, that it furnished the chief theoretical support in the last desperate struggle that was made under Julian to retain the old polytheistic worship.

Christian and Medieval Ethics.—In the present article we are not concerned with the origin of the Christian religion, nor with its outward history. Nor have we to consider the special doctrines that have formed the bond of union of the Christian communities except in their ethical aspect, their bearing on the systematization of human aims and activities. This aspect, however, must necessarily be prominent in discussing Christianity, which cannot be adequately treated merely as a system of theological beliefs divinely revealed, and special observances divinely sanctioned; for it claims to regulate the whole man, in all departments of his existence. It was not till the 4th century A.D. that the first attempt was made to offer a systematic exposition of Christian morality; and nine centuries more had passed away before a genuinely philosophic intellect, trained by a full study of Aristotle, undertook to give complete scientific form to the ethical doctrine of the Catholic church. Before, however, we take a brief survey of the progress of systematic ethics from Ambrose to Thomas Aquinas, it may be well to examine the chief features of the new moral consciousness that had spread through Graeco-Roman civilization, and was awaiting philosophic synthesis. It will be convenient to consider first the new form or universal characteristics of Christian morality, and afterwards to note the chief points in the matter or particulars of duty and virtue which received development or emphasis from the new religion.

The first point to be noticed is the new conception of morality as the positive law of a theocratic community possessing a written code imposed by divine revelation, and sanctioned by divine promises and threatenings. It is true that we find in ancient thought, from Socrates downwards, the notion of a law of God, eternal and immutable, partly expressed and partly obscured by the shifting codes and customs of actual human societies. But the sanctions of this law were vaguely and, for the most part, feebly imagined; its principles were essentially unwritten, and thus referred not to the external will of an Almighty Being who claimed unquestioning submission, but rather to the reason that gods and men shared, by the exercise of which alone they could be adequately known and defined. Hence, even if the notion of law had been more prominent than it was in ancient ethical thought, it could never have led to a juridical, as distinct from a moral, conception of morality. In Christian thought, on the other hand, we early find that the method of moralists determining right conduct is to a great extent analogous to that of jurisconsults interpreting a code. It is assumed that divine commands have been implicitly given for all occasions of life, and that they are to be ascertained in particular cases by interpretation of the general rules obtained from texts of scripture, and by inference from scriptural examples. This juridical method descended naturally from the Jewish theocracy, of which Christendom was a universalization. Moral insight, in the view of the most thoughtful Jews of the age immediately preceding Christianity, was conceived as knowledge of a divine code, emanating from an authority external to human reason which had only the function of interpreting and applying its rules. This law was derived partly from Moses, partly from the utterances of the later prophets, partly from oral tradition and from the commentaries and supplementary maxims of generations of students. Christianity inherited the notion of a written divine code acknowledged as such by the “true Israel”—now potentially including the whole of mankind, or at least the chosen of all nations,—on the sincere acceptance of which the Christian’s share of the divine promises to Israel depended. And though the ceremonial part of the old Hebrew code was altogether rejected, and with it all the supplementary jurisprudence resting on tradition and erudite commentary, still God’s law was believed to be contained in the sacred books of the Jews, supplemented by the teaching of Christ and his apostles. By the recognition of this law the church was constituted as an ordered community, essentially distinct from the State; the distinction between the two was emphasized by the withdrawal of the early Christians from civic life, to avoid the performance of certain ceremonies connected with the 각종 forms of official loyalty, and by the persecutions which they had to endure, when the spread of an association apparently so hostile to the framework of ancient society had at length alarmed the imperial government. Nor was the distinction obliterated by the recognition of Christianity as the state religion under Constantine.

Thus the juridical form in which morality was conceived only emphasized the fundamental difference between it and the laws of the state. The ultimate sanction of the moral consciousness was the infinite rewards and punishments awaiting the immortal soul hereafter; but the church early felt the necessity of withdrawing the privileges of membership from apostates and allowing them to be gradually regained only by a solemn ceremonial expressive of repentance, protracted through several years. This formal and regulated “penitence” was extended from apostasy to other grave—or, as they were subsequently called—“sins,” for minor offenses all Christians were called upon to express contrition by fasting and abstinence, and not simply from ordinarily permitted pleasures, as well as verbally in public and private devotions. “Excommunication” and “penance” thus came to be temporal ecclesiastical sanctions of the moral law. As the graduation of these sanctions naturally became more minute, a correspondingly detailed classification of offenses was rendered necessary, and thus a system of ecclesiastical jurisprudence was gradually produced, somewhat analogous to that of Judaism. At the same time this tendency to make prominent a scheme of external duties has always been counteracted by the remembrance of its original antithesis to Jewish legalism. We find that this antithesis, as exaggerated by some of the Gnostic sects of the 2nd and 3rd centuries A.D., led, not merely to theoretical antinomianism, but even (if the charges of their orthodox opponents are not entirely to be discredited) to gross immorality of conduct. A similar tendency has shown itself at other periods of church history. And though such antinomianism has always been sternly repudiated by the moral consciousness of Christendom, it has never been forgotten that “inwardness,” rightness of heart or spirit, is the pre-eminent characteristic of Christian goodness. It must not, of course, be supposed that the need of something more than mere fulfillment of external duty was ignored even by the later Judaism. Rabbinic erudition could not forget the repression of vicious acts, but it was the external conduct, not the inwardness of the heart, that was at issue. The Mosaic law, as we have seen, fixed the necessity of service to God, or the incitement by later prophets of humility and faith. “The real and only Pharisee,” says the Talmud, “is he who does the will of his Father because he loves Him.” But it remains true that the contrast with the “righteousness of the scribes and pharisees” has always served to mark the requirement of “inwardness” as a distinctive feature of the Christian code—an inwardness not merely negative, tending to the repression of vicious desires as well as vicious acts, but also involving a positive rectitude of the inner state of the soul.

In this aspect Christianity invites comparison with Stoicism, and indeed with pagan ethical philosophy generally, if we except the hedonistic schools. Rightness of purpose, preference of virtue for its own sake, suppression of vicious desires, were made essential points by the Stoics; and, though the most important necessity for the observance of outward circumstances in their view of virtue, no less than by the Stoics, to whom all outward things were indifferent. The fundamental differences between pagan and Christian ethics depend not on any difference in the value set on rightness of heart, but on different views of the essential form or conditions of this inward rightness. In neither case is it presented purely and simply as moral rectitude. By the pagan philosophers it was always conceived under the form of Knowledge or Wisdom,
it being inconceivable to all the schools sprung from Socrates that a man could truly know his own good and yet deliberately choose anything else. This knowledge, as Aristotle held, might be permanently precluded by vicious habits, or temporarily obliterated by passion, but if present in the mind it must produce rightness of purpose. Or even if it were held with some of the Stoics that true wisdom was out of the reach of the best men actually the law of the inwardness of Christian humanity manifest itself, which, though less distinctive, should yet receive attention in any comparison of Christian ethics with the view of Graeco-Roman philosophy. The profound horror with which the Christian's conception of a suffering as well as an avenging divinity tended to make him regard all condemnable acts was tinged with a sentiment which we may perhaps describe as a ceremonial aversion moralized—the aversion, that is, to founess or impurity. In Judaism, as in other, especially Oriental, religions, the natural dislike of material defilement has been elevated into a religious sentiment, and made to support a complicated system of quasi-sanitary abstinences and ceremonial purifications; then, as the ethical element predominated in the Jewish religion, a moral symbolism was felt to reside in the ceremonial code, and thus aversion to impurity came to be a common form of the ethico-religious sentiment. Then, when the Christian divinitized the Mosaic ritual, this religious sense of impurity was left with no other sphere besides morality; while, from its highly idealized character, it was peculiarly well adapted for that repression of vicious desires which Christianity claimed as its special function.

The distinctive features of Christian ethics are obedience, unworldliness, benevolence, purity, and humility. They are naturally connected with the more general characteristics just stated; though many of them may also be referred directly to the examples and precepts of Christ, and in several cases they are clearly due to both causes, inseparably combined.

1. We may notice, in the first place, that the conception of morality as a code which, if not in itself arbitrary, is yet to be accepted by men with unquestioning submission, tends naturally to bring into prominence the virtue of obedience to authority; just as the philosophic view of goodness as the realization of reason gives a special value to self-determination and independence (as we see more clearly in the post-Aristotelian schools where ethics is distinctly separated from politics).

2. Again, the opposition between the natural world and the spiritual order into which the Christian has been born anew led not merely to a contempt equal to that of the Stoic for wealth, fame, power, and other objects of worldly pursuit, but also, for some time at least, to a comparative depreciation of the domestic and civic relations of the natural man. This tendency was exhibited most simply and generally in the earliest period of the church's history. In the view of primitive Christians, ordinary human society was a world temporarily surrendered to Satanic rule, over which a swift and sudden destruction was impending; in such a world the little band who were gathered in the ark of the church could have no part or lot,—the only attribute they could maintain was that of passive alienation. Or, on the other hand, it was difficult practically to realize this alienation, and a keen sense of this difficulty induced the same hostility to the body as a clog and hindrance, that we find to some extent in Plato, but more fully developed in Neoplatonism, Neo-Platonicism, and other products of the mingling of Greek with Oriental thought. This feeling is exhibited in the value set on fasting in the Christian church from the earliest times, and in an extreme form in the self-torments of later monoastics. Yet, while both asceticism and anti-sensualism, seem to have combined in causing the preference of celibacy over marriage which is common to most early Christian writers.1 Patriotism, again, and the sense of civic duty, the most elevated of all social sentiments in the Graeco-Roman civilization, tended, under the influence of Christianity, either to expand itself into universal philanthropy, or to concentrate 1 E.g. Justin Martyr, Origen, Tertullian, Cyprian.
itself on the ecclesiastical community. “We recognize one commonwealth, the world,” says Tertullian; “we know,” says Origen, “that we have a fatherland founded by the word of God.” We might further derive from the general spirit of Christian unworldliness that repudiation of the secular modes of conflict, even in a righteous cause, which substituted a passive patience and endurance for the old pagan virtue of courage, in fact the active element was prominent. Here, however, we clearly trace the influence of Christ’s express prohibition of violent resistance to violence, and his incultivation, by example and precept, of a love that was to conquer even natural resentment. An extreme result of this influence is shown in Tertullian’s view, that no Christian could properly hold the office of a secular magistrate in which he would have to doom to death, chains, imprisonment; but even more sober writers, such as Ambrose, extend Christian passivity so far as to preclude self-defence even against a murderous assault. The common sense of Christendom gradually shook off these extravagances; but the reluctance to shed blood lingered long, and was hardly extinguished even by the growing horror of heresy. We have a curious relic of this in the later times of ecclesiastical persecution, when the heretic was doomed to the stake that he might be punished in some manner “short of bloodshed.”

5. It is, however, in the impulse to practical beneficence in all its forms, by the exaltation of love as the root of all virtues, that the most important influence of Christianity on the particulars of civilized morality is to be found; although the exact amount of this influence is here somewhat difficult to ascertain, since it merely carries further a development traceable in the history of pagan morality. This development appears when we compare the different post-Socratic systems of ethics. In Plato’s exposition of the different virtues there is no mention whatever of beneficence, although his writings show a keen sense of the importance of friendship as an element of philosophic life, especially of the intense personal affection naturally arising between master and disciple. Aristotle, goes somewhat further in recognizing the moral value of friendship (φίλια;); and though he considers that in its highest form it can be realized only by the fellowship of the wise and good, he yet extends the notion so as to include the domestic affections, and takes notice of the importance of mutual kindness in binding together all human societies. Still in his formal statement of the different virtues, positive beneficence is discernible only under the notion of "liberality," in which form its excellence is hardly distinguished from that of graceful profusion in self-regarding expenditure (We. Eth. IV. 1). Cicero, on the other hand, in his paraphrase of a Stoic treatise on external duties (De Offic.). ranks the rendering of positive services to men as a chief department of social duty; and the Stoics generally recognized the universal fellowship and natural mutual claims of human beings as such. Indeed, this recognition in later Stoicism is sometimes expressed with so much warmth of feeling as to be hardly distinguishable from Christian philanthropy. Nor was this regard for humanity merely a doctrine of the school. Partly through the influence of Stoic and other Greek philosophy, partly from the natural expansion of human sympathy, the legislation of the Empire, during the first three centuries, shows a steady development in the direction of national justice and humanity; and some similar progress may be traced in the general tone of moral opinion. Still the utmost point to which this development reached fell considerably short of the standard of Christian charity. Without dwelling on the immense impetus given to the practice of social duty generally by the religion that made beneficence a form of divine service, and identified “piety” with “piety,” it has been necessary to put down as disapproved by Christianity—(1) the severe condemnation and final suppression of the practice of exposing infants; (2) effective abhorrence of the barbarism of gladiatorial combats; (3) immediate moral mitigation of slavery, and a strong encouragement of emancipation; (4) great extension of the eunomous provision made for the sick and the poor. As regards almsgiving, however—

Citra sanguinis effusionem.
attribution of all true human virtue to supernatural grace, as well as with the belief in divine foreknowledge. All we can say is that in the development of Christian thought the conflict of conceptions was far more profoundly felt, and far more serious efforts were made or the sake of unity.

In the preceding account of Christian morality, it has been already indicated that the characteristics delineated did not all exhibit themselves simultaneously to the same extent, or with perfect uniformity throughout the church. Changes in the external condition of Christianity, the different degrees of civilization in the societies of which it was the dominant religion, and the natural development of the individual, are in the course of things, in a certain degree, promiscuous; while again, the important antagonisms of opinion within Christendom frequently involved ethical issues—even in the Eastern Church—until in the 4th century it began to be absorbed in the labour of a dogmatic construction. Thus, for example, the anti-sectarian tendencies of the new creed, to which Tertullian (100–220) gave violent and rigid expression, were exaggerated in the Montanist heresy which he ultimately joined; on the other hand, Clement of Alexandria, in opposition to the general tone of his age, maintained the value of pagan philosophy for the development of Christian faith into true knowledge (Gnosis), and the value of the natural development of man through marriage for the normal perfecting of the Christian life. So again, there is a marked difference between the writers before Augustine and those that succeeded him in all that concerns the internal conditions of Christian morality. By Justin and other apologists the need of redemption, faith, grace is indeed recognized, but the theological system depending on these notions is not sufficiently developed to come to even apparent antagonism with the freedom of the will. Christianity is for the most part conceived as essentially a proclamation through the Divine Word, to immortal beings gifted with free choice, of the true code of conduct sanctioned by eternal rewards and punishments. This legalism contrasts strikingly with the efforts of pagan philosophy to exhibit virtue as its own reward; and the contrast is triumphantly pointed out by more than one early Christian writer. Lactantius (circa 300 A.D.), for example, roundly declares that Plato and Aristotle, referring everything to this earthly life, “made virtue mere folly”; though himself maintaining, with pardonable inconsistency, that man’s highest good did not consist in mere pleasure, but in the consciousness of the filial relation of the soul to God. It is plain, however, that on this external legalistic view of duty it was impossible to maintain a difference in kind between Christian and pagan morality; the philosopher’s conformity to the rules of chastity and beneficence, so far as it went, was indistinguishable from the saint’s. But when this inference was developed in the teaching of Pelagius, it was repudiated as heretical by the church, under the powerful leadership of Augustine (354–430); and the doctrine of man’s incapacity to obey God’s law by his unaided moral energy was pressed to a point at which it was difficult to reconcile it with the freedom of the will. Augustine is fully aware of the theoretical indispensability of maintaining Free Will, from its logical connexion with human responsibility and divine justice; but he considers that these latter points are sufficiently secured if actual freedom of choice between good and evil is allowed in the single case of our progenitor Adam. For since the natura seminalis from which all men were to arise already existed in Adam, in his voluntary preference of self to God, humanity chose evil once for all; for which ante-natal guilt all men are justly condemned to perpetual absolute sin.

To show the crudity of the notion of redemption in early Christianity, it is sufficient to mention that many fathers represent Christ’s ransom as having been paid to the devil; sometimes adding that by the concealment of Christ’s divinity under the veil of humanity a certain degree of (or even great deceit) existed in the latter. Just as a certain degree of freedom was lost to the sinner in the metaphysical chain of events, so he was deprived of the possibility of willing evil.

Augustines.

Augustine.

The attempt to Christianize the old Platonic list of virtues, which we have noticed in Augustine’s system, was probably due to the influence of his master Ambrose, in whose Ambrose.

treatise De officiis ministerum we find for the first time an exposition of Christian duty systematized on a plan borrowed from a pre-Christian moralist. It is interesting to compare that of Ambrose’s with what subsequently came to be known as the “four cardinal virtues” with the corresponding delineations in Cicero’s De officiis which served the bishop as a model. Christian Wisdom, so far as it is speculative, of course primarily theological; it has God, as the highest truth, for its chief object, and is therefore necessarily grounded on faith. Christian Fortitude is essentially firmness in withstanding the seductions of good and evil fortune, resoluteness in the conflict perpetually waged against wickedness without carnal weapons—though Ambrose, with the Old Testament in his hand, will not quite relinquish the ordinary martial application of the term. “Temperantia” retains the meaning of “observance of due measure” in all conduct, which it had in Cicero’s treatise; though its notion is partly modified by being blended with the newer virtue of humility. Finally in the exposition of Christian Justice the Stoic doctrine of the natural union of all human interests is elevated to the full height and intensity of evangelical philanthropy; the brethren are reminded that the earth was made by God a common possession of all, and are bidden to administer their means for the common benefit; Ambrose, we should observe, is thoroughly aware of the fundamental union of these different virtues in Christianity, though he does not.

1 Cicero’s works are unimportant in the history of ancient ethics, as their philosophical matter was entirely borrowed from Greek treatises now lost; but the influence exercised by them (especially by the De officiis) over medieval and even modern readers was very considerable.
not, like Augustine, resolve them all into the one central affection of love of God.

Under the influence of Ambrose and Augustine, the four cardinal virtues furnished a basis on which the systematical ethical theories of subsequent theologians were built. With them the triad of Christian graces, Faith, Hope and Love, and the seven gifts of the Spirit (Isaiah xi. 2) were often combined. In antithesis to this list, an enumeration of the "deadly sins" obtained currency. These were at first commonly reckoned as eight; but a preference for mystical numbers characteristic of medieval theologians finally reduced them to seven. The statement of them is variously given,—Pride, Avarice, Anger, Gluttony, Unchastity, are found in all the lists; the remaining two (or three) are variously selected from among Envy, Vainglory, and the rather singular sins Gloominess (tristitia) and Languid Indifference (acidia or acedia, from Gr. ἀκείμηνία). These latter notions show plainly, what indeed might be inferred from a study of the list as a whole, that it represents the moral experience of the monastic life, which for some centuries was more and more unquestioningly regarded as in a peculiar sense "religious." It should be observed that the (also Augustinian) distinction between "deadly" and "venial" sins had a technical reference to the quasi-jural administration of ecclesiastical discipline, which grew gradually more organized as the spiritual power of the church was established amid the ruins of the Roman empire, and slowly developed into the theocracy that almost dominated Europe during the latter part of the middle ages. "Deadly" sins were those for which formal ecclesiastical penance was held to be necessary, in order to save the sinner from eternal damnation; for "venial" sins he might obtain forgiveness, through prayer, almsgiving, and the observance of the regular fasts. We find that "penitential books" for the use of the confessionals, founded partly on traditional practice and partly on the written decrees of synods, came into general use in the 7th century. At first they are little more than mere inventories of sins, with their appropriate ecclesiastical punishments; gradually cases of conscience come to be discussed and decided, and the basis is laid for that system of casuistry which reached its full development in the 14th and 15th centuries. This ecclesiastical jurisprudence, and indeed the general relation of the church to the ruder races with which it had to deal during this period, necessarily tended to encourage a somewhat extended view of morality. But a powerful counterpoise to this tendency was continually maintained by the fervid Inwardness of Augustine, transmitted through Gregory the Great, Isidore of Seville, Alcuin, Hrabanus Maurus, and other writers of the philosophically barren period between the destruction of the Western empire and the rise of Scholasticism.

Medieval moral philosophy.

Scholastic ethics, like scholastic philosophy, attained its completest result in the teaching of Thomas Aquinas. But before giving a brief account of the ethical part of his system, it will be well to notice the salient points in the long and active discussion that led up to it. In the pantheistic system of Erigena (q.v.) (circa 810-877) the chief philosophic element is supplied by the influence of Plato and Plotinus, transmitted through an unknown author of the 5th century, who assumed the name of Dionysius the Areopagite. Accordingly the ethical side of this doctrine has the same negative and ascetic character that we have observed in Neoplatonism. God is the only real Being; evil is essentially unreal and incognizable; the true aim of man's life is to return to the perfect union with God out of the degraded material existence into which he has fallen. This doctrine found little acceptance among Erigena's contemporaries, and was certainly unorthodox enough to justify the condemnation which it subsequently received from Honorius III.; but its influence, together with that of the Pseudo-Dionysius, had a considerable share in developing the more emotional orthodox mysticism of the 12th and 13th centuries; and Neoplatonism (or Platonism received through a Neoplatonic tradition) remained a distinct element in medieval thought, though obscured in the period of mature scholasticism by the predominant influence of Aristotle. Passing on to Anselm (1033-1109), we observe that the Augustinian doctrine of original sin and man's absolute need of unmerited grace is retained in his theory of salvation; he also follows Augustine in defining freedom as the "power not to sin"; though in saying that Adam fell "spontaneously" and "by his free choice," though not "through its freedom," he has implicitly made the distinction that Peter the Lombard afterwards expressly draws between the freedom that is opposed to necessity and freedom from the slavery of sin. Anselm further softens the statement of Augustinian predestinationism by explaining that the freedom to will is not strictly lost even by fallen man; it is inherent in a rational nature, though since Adam's sin it only exists potentially in humanity, except where it is made actual by grace.

In a more real sense Abelard (1079-1142) tries to establish the connexion between man's ill desert and his free consent. He asserts that the inherited propensity to evil is not strictly a sin, which is only committed when the conscious self yields to vicious inclination. With a similar stress on the self-conscious side of moral action, he argues that rightness of conduct depends solely on the intention, at one time pushing this doctrine to the paradoxical assertion that all outward acts as such are indifferent. In the same spirit, under the reviving influence of ancient philosophy (with which, however, he was imperfectly acquainted and the relation of which to Christianity he extravagantly disavowed), he also set about inculcating a disinterested love of good—and so implicitly love of God as the highest good—were really nearer to Christianity than Judaic legalism was. Nay, further, he required that the Christian "love to God" should be regarded as pure only if purified from the self-regarding desire of the happiness which God gives. The general tendency of Abelard's thought was suspiciously regarded by contemporary orthodoxy; and the unsoundness of the last-mentioned distinction provoked vehement replies from orthodox men on all sides of the age. Thus, Hugo of St Victor (1077-1144) argues that all love is necessarily so far "interested" that it involves a desire for union with the beloved; and since eternal happiness consists in this union, it cannot truly be desired apart from God; while Bernard of Clairvaux (1090-1153) more elaborately distinguishes four stages by which the soul is gradually led from (1) merely self-regarding desire for God's aid in distress, to (2) love him for his own sake, to (3) love and praise him, to (4) love for himself alone, until (4) in rare moments this love for himself alone becomes the sole all-absorbing affection. This controversy Peter the Lombard endeavoured to compose by the scholastic art of taking distinctions, of which he was a master. In his treatise, Libri sententiarum, mainly based on Augustinian doctrine, we find a distinct softening of the antithesis between nature and grace and an anticipation of the union of Aristotelian and Christian thought, which was initiated by Albert the Great and completed by Thomas Aquinas.

The moral philosophy of Aquinas is Aristotelianism with a Neoplatonic tinge, interpreted and supplemented by a view of Christian dogma derived chiefly from Augustine. All action or movement of all things irrational as well as rational is directed towards some end or good,—that is, really and ultimately towards God himself, the ground and first cause of all being and unmoved principle of all movement. This universal though unconscious striving after God, since he is essentially intelligible, exhibits itself in its highest form in rational beings as a desire for knowledge of him; such knowledge, however, is beyond all ordinary exercise of reason, and may be only partially revealed to man here below. Thus the summum bonum for man is objectively God, subjectively the happiness to be derived from loving vision of his perfections; although there is a lower kind of happiness to be realized here

1 Abelard afterwards retracted this view, at least in its extreme form; and in fact does not seem to have been fully conscious of the difference between (1) unfulfilled intention to do an act objectively right and (2) intention to do what is merely believed by the agent to be right.

2 He was condemned by two synods, in 1121 and 1140.
below in a normal human existence of virtue and friendship, with mind and body sound and whole and properly trained for the needs of life. The higher happiness is given to man by free grace of God; but it is given to those only whose heart is right, and as a reward of virtuous actions. Passing to consider what actions are virtuous, we first observe generally that the morality of an act is in part, but only in part, determined by its particular motive; it partly depends on its external object and circumstances, which render it either objectively in harmony with the "order of nature" or the reverse. In the classification of particular virtues and vices we can distinguish very clearly the elements supplied by the different teachings which Aquinas has imbibed. He follows Aristotle closely in dividing the "natural" virtues into intellectual and moral, giving his preference to the former class, and the intellectual again into speculative and practical; in distinguishing within the speculative class the "intellect" that is conversant with principles, the "science" that deduces conclusions, and the "wisdom" to which belongs the whole process of knowing the subtler objects of knowledge; and in treating practical wisdom as inseparably connected with moral virtues, and therefore in a sense moral. His distinction among moral virtues of the justice that renders others their due from the virtues that control the appetites and passions of the agent himself, represents his interpretation of the Nicomachean Ethics; while his account of these latter virtues is a simple transcript of Aristotle's, just as his division of the non-rational element, of the somatic into "concupiscible" and "irascible" is the old Platonic one. In arranging his list, however, he defers to the established doctrine of the four cardinal virtues (derived from Plato and the Stoics through Cicero); accordingly, the Aristotelian ten have to stand under the higher genera of (1) the prudence which gives reasoned rules of conduct, (2) the temperance which restrains misleading desire, and (3) the fortitude that resists misleading fear of dangers or toils. But before these virtues enter into the three "theologic" virtues, faith, love and hope, supernaturally "instilled" by God, and directly relating to him as their object. By faith we obtain that part of our knowledge of God which is beyond the range of mere natural wisdom or philosophy; naturally (e.g.), we can know God's existence, but not his trinity in unity, though philosophy is useful to defend this and other revealed verities; and it is essential for the soul's weariness that all articles of the Christian creed, however little they can be known by natural reason, should be apprehended through faith; the Christian who rejects a single article loses hold altogether of faith and of God. Faith is the substantial basis of all Christian morality, but without love—the essential form of all the Christian virtues—it is "formless" (infemis). Christian love is conceived (after Augustine) as primarily love to God (beyond the natural yearning of the creature after its ultimate good), which expands into love towards all God's creatures as created by him, and so ultimately includes even self-love. But creatures are only to be loved in their purity as created by God; all that is bad in them must be an object of hatred till it is destroyed. In the classification of sins the Christian element predominates; still we find the Aristotelian vices of excess and defect, along with the modern divisions into sins against God, neighbour and self, "mortal and venial sins," and so forth.

From the notion of sin—treated in its jural aspect—Aquinas passes naturally to the discussion of Law. The exposition of this conception presents to a great extent the same matter that was dealt with by the exposition of moral virtues, but in a different form; the prominence of which may perhaps be attributed to the growing influence of Roman jurisprudence, which attained in the 12th century so rapid and brilliant a revival in Italy. This side of Thomas's system is specially important, since it is just this blending of theological and philosophical with the abstract theory of the later Roman law that gave the starting-point for independent ethical thought in the modern world. Under the general idea of law, defined as an "ordainment of reason for the common good, promulgated by him who has charge of the community," Thomas distinguishes (1) the eternal law or regulative reason of God which embraces all his creatures, rational and irrational; (2) "natural law," being that part of the eternal law that relates to rational creatures as such; (3) human law, which properly consists of more particular deductions from natural law particularized and adapted to the varying circumstances of actual communities; (4) divine law specially revealed to man. As regards natural law, he teaches that God has implanted in the human mind a knowledge of its immutable general principles; and not only knowledge, but a disposition, to which he applies the peculiar scholastic name synergésis, 1 that unerringly prompts to the realization of these principles in conduct, and protests against their violation. All acts of natural virtue are implicitly included within the scope of this law of nature; but in the application of its principles to particular cases—to which the term "conscience" should be restricted—man's judgment is liable to err, the light of nature being obscured and perverted by bad education and custom. Human law is required, not merely to determine the details for which natural law gives no intuitive guidance, but also to supply the force necessary for practically securing, among imperfect men, the observance of the most necessary rules of mutual behaviour. The rules of this law must be either deductions from principles of natural law, or determinations of particulars which it leaves indeterminate; a rule contrary to nature could not be valid as law at all. Human law, however, can deal with outward conduct alone, and natural law, as we have seen, is liable to be vague and obscure in particular applications. Neither natural nor human law, moreover, takes into account that supernatural happiness which is man's highest end. Hence they need to be supplemented by a special revelation of divine law. This revelation is distinguished into the law of the old covenant and the law of the gospel; the latter of these is productive as well as imperative since it carries with it the divine grace that makes it possible. We have, however, to distinguish in the case of the gospel between (1) absolute commands and (2) "counsels," which latter recommend, without positively ordering the monastic life of poverty, celibacy and obedience as the best method of effectively turning the will from earthly to heavenly things.

But how far is man able to attain either natural or Christian perfection? This is the part of Thomas's system in which the cohesion of the different elements seems weakest. He is scarcely aware that his Aristotelianized Christianity inevitably combines two different difficulties in dealing with this question: first, the old pagan difficulty of reconciling the proposition that will is a rational desire always directed towards apparent good, with the freedom of choice between good and evil that the jural view of morality seems to require; and, secondly, the Christian difficulty of harmonizing this latter notion with the absolute dependence on divine grace which the religious consciousness affirms. The latter difficulty Thomas, like many of his predecessors, avoids by supposing a "co-operation" of free-will and grace, but the former he does not fully meet. It is against this part of his doctrines that the most important criticism, in ethics, of his rival Duns Scotus (c. 1266-1308) was directed. He urged that will could not be really free if it were bound to reason, as Thomas (after Aristotle) conceives it; a really free choice must be perfectly indeterminate between reason and unreason. Scotus consistently maintained that the divine will is similarly independent of reason, and that the divine ordering of the world is to be conceived as absolutely arbitrary. On this point he was followed by the acute intellect of William of Occam (d. c. 1347). This doctrine is obviously hostile to all reasoned morality; and in fact, notwithstanding the dialectical ability of Scotus and Occam, the work of Thomas remains indubitably the crowning result of the great constructive effort of medieval philosophy. The effort was, indeed, foredoomed to failure, since it attempted the impossible task of framing a coherent

1 Synergésis (Gr. συνεργέσις, from συνέργος, to work closely, observe) is used in this sense in Jerome (Com. in Ezech. i. 5-10).
system out of the heterogeneous data furnished by Scripture, the fathers, the church and Aristotle—equally unquestioned, if not equally venerated, authorities. Whatever philosophic quality is to be found in the work of Thomas belongs to it in spite of, not in consequence of, its method. Still, its influence has been great and long-enduring—in the Catholic Church primarily, but indirectly became the Protestant of the Reformation. The famous first book of Hooker's Ecclesiastical Polity is to a great extent taken from the Summa theologica. Partly in conscious antagonism to the schoolmen, yet with close affinity to the central ethical-theological doctrine which they read out of or into Aristotle, the mystical manner of thought continued to maintain itself in the church.

Philosophically it rested upon Neoplatonism, but its development in strict connexion with Christian orthodoxy begins in the 12th century with Bernard of Clairvaux and Hugo of St Victor. It blended the Christian element of love with the ecstatic vision of Plotinus, sometimes giving the former a decided predominance. In its more moderate form, keeping wholly within the limits of ecclesiastical orthodoxy, this mysticism is represented by Bonaventura and Gerson; while it appears more independent and daringly constructive in the German Eckhart, advancing in some of his followers to open breach with the church, and to practical immorality.

In the brief account above given of the general ethical view of Thomas Aquinas no mention has been made of the detailed discussion of particular duties included in the Summa theologica; in which, for the most part, an excellent combination of moral elevation with sobriety of judgment is shown, though on certain points the scholastic pedantry of definition and distinction is unfavourable to due delicacy of treatment. As the properly philosophic interest of scholasticism faded in the 14th and 15th centuries, the quasi-legal treatment of morality came again into prominence, borrowing a good deal of matter from Thomas and other schoolmen. One result of this was a marked development and systematization of casuistry. The best known Summae casuum conscientiae, compiled for the conduct of auricular confession, belong to the 14th and 15th centuries. The oldest, the Aestasana, from Asti in Piedmont, is arranged as a kind of text-book of morality on a scholastic basis; later manuals are merely lists of questions and answers. It was inevitable that, in proportion as this casuistry assumed the character of a systematic penal jurisprudence, its precise determination of the limits between the prohibited and the allowable, with all doubtful points closely scrutinized and illustrated by fictitious cases, would have a tendency to weaken the moral sensibilities of ordinary minds; the greater the industry spent in deducing conclusions from the diverse authorities, the greater necessarily the number of points on which voluntary conscience disagreed; and the central authority that might have repressed serious divergences was wanting in the period of moral weakness

that the church went through after the death of Boniface VIII. A plain man perplexed by such disagreements might naturally hold that any opinion maintained by a pious and orthodox writer must be a safe one to follow; and thus weak consciences were subtly tempted to seek the support of authority for some desired relaxation of a moral rule. It does not, however, appear that this danger assumed formidable proportions until after the Reformation; when, in the struggle made by the Catholic church to recover its hold on the world, the principle of authority was, as it were, forced into keen, balanced and prolonged conflict with that of reliance on private judgment. To the Jesuits, the foremost champions in this struggle, it seemed indispensable that the confessional should be made attractive among the Protestants, especially since the law which in this purport must appear somehow "accommodated" to worldly needs; and the theory of "Probabilism" supplied a plausible method for effecting this accommodation. The theory proceeded thus: A layman could not be expected to examine minutely into a point on which

1 The refusal of the council of Constance to condemn Jean Petit’s advocacy of assassination is a striking example of this weakness. Cf. Milman, Lat. Christ. book xii. c. 9.

the learned differed; therefore he could not fairly be blamed for following any opinion that rested on the authority of even a single doctor; therefore his confessor must be authorized to hold him guiltless if any such "probable" opinion could be produced in his favour; nay, it was his duty to suggest such an opinion, even though opposed to his own, if it would relieve him from the charge of heresy in Ecumenical Councils. The results to which this Probabilism, applied with an earnest desire to avoid dangerous rigour, led in the 17th century were revealed to the world in the immortal lettres provinciales of Pascal.

In tracing the development of casuistry we have been carried beyond the great crisis through which Western Christianity passed in the 16th century. The Reformation which Luther initiated may be viewed on several sides, even if we consider only its ethical principles and effects. It maintained the simplicity of Apostolic Christianity against the elaborate system of a corrupt hierarchy, the teaching of Scripture alone against the commentaries of the fathers and the traditions of the church, the right of private judgment against the dictation of ecclesiastical authority, the individual responsibility of every human soul before God in opposition to the papal control over purgatorial punishments, which had led to the revolting degradation of venal indulgences. Reviving the original antithesis between Christianity and Jewish legalism, it maintained the inwardness of faith to be the sole way to eternal life, in contrast to the outwardness of works; returning to Augustine, and expressing his spirit in a new formula, to resist the Neo-Pelagianism that had gradually developed itself within the apparent Augustinianism of the church, it maintained the total corruption of human nature, as contrasted with that "congruity" by which, according to the schoolmen, divine grace was to be earned; renewing the fervent humility of St Paul, it enforced the universal and absolute imperativeness of all Christian duties, and the inevitable unworthiness of all Christian obedience, in opposition to the theory that "condign" merit might be gained by "supererogatory" conformity to evangelical "counsels." It will be seen that these changes, however profoundly important, were, ethically considered, either negative or quite general, relating to the tone and attitude of mind in which all duty should be done. As regards all positive matter of duty and virtue, and most of the prohibitive code for ordinary men, the tradition of Christian teaching was carried on substantially unchanged by the Reformed churches. Even the old method of casuistry was maintained during the 16th and 17th centuries; though Scriptural texts, interpreted and supplemented by the light of natural reason, now furnished the sole principles on which cases of conscience were decided.

In the 17th century, however, the interest of this quasi-legal treatment of morality gradually faded; and the ethical studies of educated minds were occupied with the attempt, renewed after so many centuries, to find an independent philosophical basis for the moral code. The renewal of this attempt was only indirectly due to the Reformation; it is rather to be connected with the more extreme reaction from the mediaval religion which was partly caused by, partly expressed in, that enthusiastic study of the remains of old pagan culture that spread from Italy over Europe in the 15th and 16th centuries. To this "humanism" the Reformation seemed at first more hostile than the Roman hierarchy; indeed, the extent to which this latter had allowed itself to become paganized by the Renaissance was one of the points that especially roused the Reformers' indignation. Not the less important is the indirect stimulus which this change in view lent to the development of a moral philosophy independent alike of Catholic and Protestant assumptions. Scholasticism, while reviving philosophy as a handmaid to theology, had metamorphosed its method into one resembling that of its mistress; thus shackling the renaissance intellectual freedom.

2 As the chief English casuists we may mention Perkins, Hall, Sanderson, as well as the more eminent Jeremy Taylor, whose Doctor dubium, appeared in 1660.
activity which it stimulated by the double bondage to Aristotle and to the church. When the Reformation shook the traditional authority in one department, the church was necessarily felt in the other. Fifty years after Luther's defiance of the startled thesis "that all that Aristotle taught was false" was prosperously maintained by the youthful Ramus before the university of Paris; and almost contemporaneously the group of remarkable thinkers in Italy who heralded the dawn of modern physical science—Cardanu, Telesio, Patrizii, Campanella, Bruno—began to propound their Aristotelian theories of the constitution of the physical universe. It was to be foreseen that a similar assertion of independence would make itself heard in ethics also; and, indeed, amid the clash of dogmatic convictions, and the variations of private judgment, it was natural to seek for an ethical method that might claim universal acceptance from all sects.

C. Modern Ethics.—The need of such independent principles was most strongly felt in the region of man's civil and political relations, especially the mutual relations of communities. Accordingly we find that modern ethical controversy began in a discussion of the law of nature. Albericus Gentilis (1557-1611) and Hugo Grotius (1583-1645) were the first to give a systematic account. Natural law, according to Grotius and other writers of the age, is that part of divine law which follows from the essential nature of man, who is distinguished from animals by his "appetite" for tranquil association with his fellows, and his tendency to act on general principles. It is therefore as unalterable, even by God himself, as the truths of mathematics, although its effect may be restrained in a particular case by an express command of God; hence it is cognizable a priori, from the abstract consideration of human nature, though its existence may be known a posteriori also from its universal acceptance in human societies. The conception, as we have seen, was taken from the later Roman jurists; by them, however, the law of nature was conceived as something that underlay existing law, and was to be looked for through it, though it might ultimately supersede it, and in the meanwhile represented an ideal standard, by which improvements in legislation were to be guided. Still the language of the jurists in some passages (cf. Inst. of Justinian, ii, 1, 2) clearly implied a period of human history in which men were governed by natural law alone, prior to the institution of civil society. Posidonius had identified this period with the mythical "golden age"; and such ideas easily coalesced with the narrative in Genesis. Thus there had become blown in a new idea of "state of nature" in which individuals or single families lived side by side—under none other than those "natural" laws which prohibited mutual injury and interference in the free use of the goods of the earth common to all, and upheld parental authority, fidelity of wives, and the observance of compacts freely made. This conception Grotius took, and gave it additional force and solidity by using the principles of this natural law for the determination of international rights and duties, it being obvious that independent nations, in their corporate capacities, were still in that "state of nature" in their mutual relations. It was not, of course, assumed that these laws were universally obeyed; indeed, one point with which Grotius is especially concerned is the natural right of private war, arising out of the violation of more primary rights. Still a general observance was involved in the idea of a natural law as a "dictate of right reason indicating the agreement or disagreement of an act with man's rational and social nature"; and we may observe that it was especially necessary to assume such a general observance in the case of contracts, since it was by an "express or tacit pact" that the right of property (as distinct from the mere right to non-interference during use) was held by him to have been instituted. A similar "fundamental pact" had long been generally regarded as the normal origin of legitimate sovereignty.

The ideas above expressed were not peculiar to Grotius; in particular the doctrine of the "fundamental pact" as the jural basis of government had long been maintained, especially in England, where the constitution historically established readily suggested such a compact. At the same time the rapid and remarkable success of Grotius's treatise (De jure beli et pacis) brought his view of Natural Right into prominence, and logical view of which Hobbes had been led to contemplate so deeply to some extent under the influence of Bacon, partly perhaps through association with his younger contemporary Gassendi, who, in two treatises, published between the appearance of Hobbes's De cive (1642) and that of the Leviathan (1651), endeavoured to revive interest in Epicurus. Hobbes's psychology is in the first place materialistic; he holds, that is, that in any of the psychophysical phenomena of human nature the reality is a material process of which the mental feeling is a mere "appearance." Accordingly he regards pleasure as essentially motion "helping vital action," and pain as motion "hindering" it. There is no logical connexion between this theory and the doctrine that appetite of desire has always pleasure (or the absence of pain) for its object; but a materialist, framing a system of psychology, will naturally direct his attention to the impulses arising out of bodily wants, whose obvious end is the preservation of the agent's organism; and this, together with a philosophic wish to simplify, may have led him to the conclusion that human impulses are similarly self-regarding. This, at any rate, is Hobbes's cardinal doctrine in moral psychology, that each man's appetites or desires are naturally directed either to the preservation of his life, or to that heightening of it which he feels as pleasure. Hobbes does not distinguish instinctive from deliberate pleasure-seeking; and he confidently resolves the most apparently unselfish emotions into phases of self-regard. Pity he finds to be grief for the calamity of others, arising from imagination of the like calamity befalling oneself; what we admire with seeming disinterestedness as beautiful (pulchrum) is really "pleasure in promise"; when men are not immediately seeking present pleasure, they desire power as a means to future pleasure, and thus have a derivative delight in the exercise of power that prompts to what we call benevolent action. Since, then, all the voluntary actions of men tend to their own preservation or pleasure, it cannot be unreasonable to aim at human impulses are similarly self-regarding. This, at any rate, is Hobbes's cardinal doctrine in moral psychology, that each man's appetites or desires are naturally directed either to the preservation of his life, or to that heightening of it which he feels as pleasure. ETHICS

the system of "use the strength and means of all" to enforce on all the observance of rules tending to the common benefit. On the other hand Hobbes yields to no one in maintaining the paramount importance of moral regulations. The precepts of good faith, equity, retribution of benefits, forgiveness of wrong so far as security allows, the prohibition of contumely, pride, arrogance, and so on, are firmly embodied under the formula, "Do the greatest good to thyself and to another which thou wouldst not have done to thyself" (i.e. the negative of the "golden rule")—he still calls "immutable and eternal laws of nature"—meaning that, though a man is not unconditionally bound to realize them, he is, as a reasonable being, bound to desire that they should be realized. The pre-social state of man, in his view, is also pre-moral; but it is therefore utterly miserable. It is a state in which every one has a right to everything that may conduce to his preservation, but it is therefore also a state of war—a state so sordid that it is the first dictate of rational self-love to emerge from it into social peace and order. Hence Hobbes's ideal constitution naturally comes to be an unquestioned and unlimited—though not necessarily monarchical—despotism. Whatever the government declares to be just or unjust must be accepted as such, since to dispute its dictates would be the first step towards the one paramount peril outwitting all particular defects in legislation and administration. It is perhaps easy to understand how, in the crisis of 1640, when the ethical-political system of Hobbes first took written shape, a peace-loving philosopher should regard the claims of individual conscience as essentially anarchical, and dangerous to social well-being; but however strong might be men's yearning for order, a view of social duty, in which the only fixed positions were selfishness everywhere and unlimited power somewhere, could not but appear offensively paradoxical.

There was, however, in his theory an originality, a force, an apparent coherence which rendered it undeniably impressive; in fact, we find that for two generations the efforts to construct morality on a philosophical basis take more or less the form of answers to Hobbes. From an ethical point of view Hobbes divides itself naturally into two parts, which by Hobbes's peculiar political doctrines are combined into a coherent whole, but are not otherwise necessarily connected. Its theoretical basis is the principle of egoism; while, for practically determining the particulars of duty it makes morality entirely dependent on positive law and institution. It thus affirmed the relativity of good and evil in a double sense: good and evil, for any individual citizen, may from one point of view be defined as the objects respectively of his desire and his aversion; from another, they may be said to be determined for him by his society. Apart from this system which might be attacked by the first generation of writers who replied to Hobbes. This attack, or rather the counter-exposition of orthodox doctrine, is conducted on different methods by the Cambridge moralists and by Cumberland respectively. Cumberland is content with the legal view of morality, but endeavours to establish the validity of the laws of nature by taxing them on the single supreme principle of rational regard for the "common good of all," and showing them, as so based, to be adequately supported by the divine sanction. The Cambridge school, regarding morality primarily as a body of truth rather than a code of rules, insist on its absolute character and intuitive certainty.

Cudworth was the most distinguished of the little group of thinkers at Cambridge in the 17th century, commonly known as the Cambridge Platonists (q.v.). In his treatise on Eternal and Immortal Morality his main aim is to maintain the "essential and eternal distinctions of good and evil" as independent of mere will, whether human or divine. These distinctions, he insists, have an objective reality. They are recognizable by reason no less than the relations of space or number; and he endeavours to refute the "Hobism—which he treats as a "novum paganism," a mere revival of the relativity of Protagoras—chiefly by the following argumentum ad hominem. He argues that Hobbes's atomic materialism involves the conception of an objective physical world, the object not of passive sense that varies from man to man, but of the active intellect that is the same in all; there is therefore, he says, an inconsistency in refusing to admit a similar exercise of intellect in morals, and an objective world of right and wrong, which the mind by its normal activity clearly apprehends as such.

Cudworth, in the work above mentioned, gives no systematic exposition of the ethical principles which he holds to be thus intuitively apprehended. But we may supply this deficiency from the Enchiridion Ethicum of Henry More, another thinker of the same school. More gives a list of 23 Nomina Moralia, the truth of which, he says, is immediately manifest. Some of these admit of a purely egotistic use, while others are so understood by the author—e.g. that goods differ in quality as well as in duration, and that the superior good or the lesser evil is always to be preferred; that absence of a given amount of good is preferable to the presence of equivalent evil; that future good or evil is to be regarded as much as present, if equally certain, and nearly as much as if very probable. Objections, both general and special, might be urged by a Hobist against these modes of formulating man's natural pursuit of self-interest, but the serious controversy between Hobism and modern Platonism related not to such principles as these, but to others—which demand from the individual a (real or apparent) sacrifice for his fellows. Such are the evangelical principle of "doing as you would be done by"; the principle of justice, or "giving every man his own, and letting him enjoy it without interference"; and especially what More states as the abstract formula of benevolence, that "if it be good that one man should be supplied with the means of living well and happily, it is mathematically certain that it is doubly good that two should be so supplied, and so on." The question, however, still remains, what motive any individual has to conform to these social principles when they conflict with his natural desires. To this Cudworth gives no explicit reply, and the answer of More is hardly clear. On the one hand he maintains that these principles express an absolute good, which is to be called intellectual because its essence and truth are apprehended by the intellect. But the mind is incapable from this that the intellect, so judging, is itself the proper and complete determinant of the will, and that man, as a rational being, ought to aim at the realization of absolute good for its own sake. In spite, however, of possible inferences from his definition of virtue, this does not seem to be really More's view. He explains that though absolute good is discerned by the intellect, the "sweetness and flavour" of it is apprehended, not by the intellect proper, but by what he calls a "boniforty faculty," and it is in this sweetness and flavour that the motive to virtuous conduct lies; ethics is the "art of living well and happily," and true happiness lies in the "pleasure which the soul derives from the sense of virtue." In short, More's Platonism appears to be really as hedonistic as Hobism; only the feeling to which it appeals as ultimate motive is of a kind that only a mind of exceptional moral refinement can habitually feel with the degree of intensity required.

It is to be observed that though More lays down the abstract principle of regarding one's neighbour's good as much as one's own with the full breadth with which Christianity inculcates it, yet when he afterwards comes to classify virtues he is too much under the influence of Platonic-Aristotelian thought to give a distinct place to benevolence, except under the old form of liberality. In this respect his system presents a striking contrast to Cumberland's, whose treatise De Legibus Naturae
(1672), though written like More's in Latin, is yet in its ethical matter thoroughly modern. Cumberland is a thinker both original and comprehensive, and, in spite of defects in style and clearness, he is noteworthy as having been the first to lay down that "regard for the common good of all" is the supreme moral duty, which was later to be fairly called the precursor of later utilitarianism. His fundamental principle and supreme "law of nature" is thus stated: "The greatest possible benevolence of every rational agent towards all the rest constitutes the happiest state of each and all, so far as depends on their own power, and is necessarily required for their happiness; accordingly Common Good will be the Supreme Good." It is, however, important to notice that in his "good" is included not merely 'happiness but 'perfection', and he does not even define perfection so as to exclude it from the notion of absolute moral perfection and save his theory from an obvious logical circle. A notion so vague could not possibly be used with any precision for determining the subordinate rules of morality; but in fact Cumberland does not attempt this; his supreme principle is designed not to rectify, but merely to support and systematize, common morality. This principle, as was said, is conceived as strictly a law, and therefore it is, rather, God, and God alone, who is obtained just as the effects on the agent's happiness. That the divine will is expressed by it, Cumberland, "not being so fortunate as to possess innate ideas," tries to prove by a long inductive examination of the evidences of man's essential sociability exhibited in his physical and mental constitution. His account of the sanction, again, is sufficiently comprehensive, including both the internal and the external rewards of virtue and punishments of vice; and he, like later utilitarians, explains moral obligation to lie in the force exercised on the will by these sanctions; but as to the precise manner in which individual is implicated with universal good, and the operation of either or both in determining the volition, his view is indistinguishable from actually inconsistent.

The clearness which we seek in vain from Cumberland is found to the fullest extent in Locke, whose Essay on the Human Understanding (1690) was already planned when Cumberland's treatise appeared. Yet Locke's ethical opinions have been widely misunderstood; since from a confusion between "innate ideas" and "intuitions," which has been common in recent ethical discussion, it has been supposed that the founder of English empiricism must necessarily have been hostile to "intuitional" ethics. The truth is that, while Locke agrees entirely with Hobbes as to the egoistic basis of rational conduct, and the interpretation of "good" and "evil" as "pleasure" and "pain," or that which is productive of pleasure and pain, he expressly enumerates entire holding ethical rules to be actually obligatory independently of political society, and capable of being scientifically constructed on principles intuitively known,—though he does not regard these principles as implanted in the mind at birth. The aggregate of such rules he conceives as the law of God, carefully distinguishing it, not only from civil law, but from the law of opinion or reputation, the varying moral standard by which men actually distribute praise and blame; as being, it is necessarily sanctioned by adequate rewards and punishments. He does not, indeed, speak of the scientific construction of this code as having been actually effected, but he affirms its possibility in language remarkably strong and decisive. "The idea," he says, "of a Supreme Being, infinite in power, goodness, and wisdom, whose workmanship we are, and upon whom we depend, and the idea of ourselves, as understanding rational beings, being such as is clear in us, would, I say, induce me to act and vice to be avoided, though a man was sure for his own particular to gain no profit above the practice of either." He fully admits that the question is altered when vice is attended by pleasure and profit to the vicious man, virtue by loss and calamity; and even that it is "not truly reasonable that men by adhering to virtue should part with their lives, as the common happiness of the beings affected by the action; but Locke does not explicitly adopt this standard. The only instances which he gives of intuitive moral truths are the purely formal propositions, "No government allows absolute liberty," and "Where there is no property there is no injustice,"—neither of which has any evidential connection with the general happiness. As regards his conception of the Law of Nature, he takes it in the main immediately from Grotius and Pufendorf, more remotely from the Stoics and the Roman jurists.

We might give, as a fair illustration of Locke's general conception of ethics, a system which is frequently represented as diametrically opposed to Lockism; namely, that expounded in Clarke's Boyle lectures on the Being and Attributes of God in his Principles of Human Knowledge. It is true particularly concerned with the ethical-theological proposition which Clarke is most anxious to maintain,—that the fundamental rules of morality are independent of arbitrary will, whether divine or human. But in his general view of ethical principles as being, like mathematical principles,1 essentially truths of relation, Clarke is quite in accordance with Locke; while of the four fundamental rules that he expounds, Piety towards God, Equity, Benevolence and Sobriety (which includes self-preservation), the first is a formal statement of the golden rule of the gospel. We may observe that, in stating the principle of benevolence," since the greater good is always most fit and reasonable to be done, every rational creature ought to do all the good it can to its fellow-creatures," Clarke avowedly follows Cumberland, from whom he quotes the further sentence that "universal love and benevolence is as plainly the most direct, certain and effectual means to this good as the flowing of a point is to produce a line." The quotation may remind us that the analogy between ethics and mathematics ought to be traced further back than Locke; in fact, it results from the influence exercised by Cartesianism over English thought generally, in the latter half of the 17th century. It must be allowed that Clarke is misled by the analogy to use general ethical terms ("fitness," "agreement" of things, &c.), which overlook the essential distinction between what is and what ought to be; and even in one or two expressions to overlook this distinction extravagantly, as (e.g.) in saying that the "good" who "willingly consent to the common good," what they are not and cannot be." What he really means is less paradoxically stated in the general proposition that "originally and in reality it is natural and (morally speaking) necessary that the will should be determined in every action by the reason of the thing and the right of the case, as it is natural and (absolutely speaking) necessary that the understanding should submit to a demonstrated truth." But though it is an essential point in Clarke's view that what is right is to be done as such, apart from any consideration of pleasure or pain, it is to be inferred that he is not prepared to apply this doctrine in its unqualified form to such a creature as man, who is partly under the influence of irrational impulses. At least when he comes to argue the need of future rewards and punishments we find that his claim on behalf of morality is startlingly reduced. He now only contends that "virtue deserves to be chosen for its own sake and vice to be avoided, though a man was sure for his own particular to gain no profit above the practice of either." It is also noticed, however, that it is only in his treatment of Equity and Benevolence that he really follows out the mathematical analogy (cf. Sidgwick's History of Ethics, 5th ed., pp. 180-181).
if thereby they deprived themselves of all possibility of receiving any advantage from their adherence.

Thus, on the whole, the imperative earnestness with which Clarke refutes the doctrine of natural moral law only renders more manifest the difficulty of establishing ethics on an independent philosophical basis; so long at least as the psychological egomism of Hobbes is not definitely assailed and overthrown. Until this is done, the utmost demonstration of the abstract reasonableness of social duty only leaves us with an irreconcilable antagonism between the view of abstract reason and the self-love which is allowed to be the root of man's appetitive nature. Let us grant that there is as much intellectual absurdity in being unjustly as in denying that two and two make four; still, if a man has to choose between absurdity and unhappiness, he will naturally prefer the former; and Clarke, as we have already seen, is not really prepared to maintain that such preference is irrational.

Shaftesbury.

It remains to try another psychological basis for ethical construction; instead of presenting the principle of social duty as a fact, we may try to exhibit the naturalness of man's social affections, and demonstrate a normal harmony between these and his self-regarding impulses. This is the line of thought which Shaftesbury (1671-1713) may be said to have initiated. This theory had already been advanced by Cumberland and others, but Shaftesbury was the first to make it the cardinal point in his system; no one had yet definitely transferred the whole of ethical principle from the Moral Sense to the human faculties. By comprehending either abstract moral distinctions or laws of divine legislation, for the emotional impulses that prompt to social duty; no one had undertaken to distinguish clearly, by analysis of experience, the disinterested and self-regarding elements of our appetitive nature, or to prove inductively their perfect harmony. In his Inquiry concerning Virtue and Merit he begins by attacking the egomism of Hobbes, which, as we have seen, was not necessarily excluded by the doctrine of rational intuition derived from the heart; as such, an egomism is the source of all moral distinctions. The interpretation, he says, be true only if we considered man as a wholly unrelated individual. Such a being we might doubtless call "good," if his impulses were adapted to the attainment of his own felicity. But man we must and do consider in relation to a larger system of which he forms a part, and so we call him "good" only when his impulses and dispositions are so balanced as to tend towards the good of this whole. And again we do not attribute goodness to him because his outward acts have beneficial results. When we speak of a man as good, we mean that his dispositions or affections are such as tend of themselves to promote the good or happiness of human society. Hobbes's moral man, who, if he keep loose from governmental constraint, would straightforwardly spread ruin among his fellows, is not what we commonly agree to call good. Moral goodness, then, in a "sensible creature" implies primarily disinterested affections, whose direct object is the good of others; but Shaftesbury does not mean (as he has been misunderstood to mean) that only such benevolent social impulses are good, and that these are always good. On the contrary, he is careful to point out, first, that immoderate social affections defeat themselves, miss their proper end, and are therefore bad; secondly, that as an individual's good is part of the good of the whole "self-affections" existing in a duty limited degree are morally good. Goodness, in short, consists in due combination, in just proportion, of both sorts of "affections," tendency to promote general good being taken as the criterion of the right degrees and proportions. This being established, the main aim of Shaftesbury's argument is to prove that the same balance of private and social affections, which tends naturally to public good, is also conducive to the happiness of the individual in whom it exists. Taking the different impulses in detail, he first shows how the individual's happiness is promoted by developing his social affections, mental pleasures being superior to bodily, and the pleasures of benevolence the richest of all. In discussing these he distinguishes, with well-applied subtility, between the pleasurelessness of selfishness in a certain degree, the sympathetic enjoyment of the happiness of others, and the pleasure arising from a consciousness of their love and esteem. He then exhibits the unhappiness that results from any excess of the self-regarding impulses, bodily appetite, desire of wealth, emulation, resentment, even love of life itself; and ends by dwelling on the intrinsic painlessness of all malevolence.

One more special impulse remains to be noticed. We have seen the goodness of character consists in a certain harmony of self-regarding and social affections. But virtue, in Shaftesbury's view, is something more; it implies a recognition of moral goodness and immediate preference of it for its own sake. This immediate pleasure that we take in goodness (and displeasure in its opposite) is due to a susceptibility which he calls the "relex" or "moral sense, and compares with our susceptibility to beauty and deformity in external things; it furnishes both an additional direct impulse to good conduct, and an additional gratification to be taken into account in the reckoning which proves the coincidence of virtue and happiness. This doctrine of the moral sense is sometimes represented as Shaftesbury's cardinal tenet; but though characteristic and important, it is not really necessary to his main argument; it is the crown rather than the keystone of his ethical structure.

The appearance of Shaftesbury's Characteristicks (1714) marks a turning point in the moral history of English thought. With the generation of moralists that followed, the consideration of abstract rational principles falls into the background, and its place is taken by introspective study of the human mind, observation of the actual play of its various impulses and sentiments. This empirical psychology had not indeed been neglected by previous writers. More, among others, had imitated Descartes in a discussion of the passions, and Locke's essay had given a still stronger impulse in the same direction; still, Shaftesbury is the first moralist who distinctly takes psychological experience as the basis of ethics. His suggestions were developed by Hutcheson into one of the most elaborate systems of moral philosophy which we possess; through Hutcheson, if not directly, they influenced Hume's speculations, and are thus connected with later utilitarianism. Moreover, the substance of Shaftesbury's main argument was adopted by Butler, though it could not pass the scrutiny of that powerful and cautious intellect without receiving important modifications and additions. On the other hand, the ethical optimism of Shaftesbury, rather broadly impressive than exactly reasoned, and connected as it was with a natural theology that implied the Christian scheme to be superfluous, challenged attack equally from orthodox divines and from cynical freethinkers. Of these latter Mandeville, the author of The Fable of the Bees, or Private Vices Public Benefits (1723), was a conspicuous if not a typical specimen. He can hardly be called a "moralist"; and though it is impossible to deny him a considerable share of philosophic penetration, his anti-moral paradoxes have not even apparent coherence. He is convinced that virtue (where it is more than a mere pretence) is purely artificial; but not quite certain whether it is a useless trammel of appetites and passions that are advantageous to society, or a device creditable to the politicians who introduced it by playing upon the "pride and vanity" of the "silly creature man." The view, however, to which he gave audacious expression, that moral regulation is something alien to the natural man, and imposed on him from without, should have been very current in the polite society of his time, as we learn both from Berkeley's Alchiphron and from Butler's more famous sermons.

The view of "human nature" against which Butler preached was not exactly Mandeville's, nor was it properly to be called

---

1 It should be observed that, while Clarke is sincerely anxious to prove that most principles are binding independently of Divine appointment, he is not less convinced to show that morality requires the practical support of revealed religion.

2 Three classes of impulses are thus distinguished by Shaftesbury: —(1) "Natural Affections," (2) "Self-affections," and (3) "Unnatural Affections." The last characteristics are further considered in the History of Ethics, p. 186 seq.
Hobbist, although Butler fairly treats it as having a philosophical basis in Hobbes's psychology. It was, so to say, the Hobbism turned inside out,—rendered licentious and anarchical instead of constructive. Hobbes had said "the natural state of man is non-moral, unregulated; moral rules are not the dictates of peace, but the dictates of self-preservation." On this view morality, though dependent for its actuality on the social compact which establishes government, is actually binding on man as a reasonable being. But the quasi-theistic assumption that what is natural must be reasonable remained in the minds of Hobbes's most docile readers, and in combination with his thesis that egoism is natural, tended to produce results which were dangerous to social well-being. To meet this view Butler does not contest himself, as it were, carelessly supposed, with insisting on the natural claim to authority of the conscience which his opponent repudiated as artificial; he adds a subtle and effective argument ad hominem.

He first follows Shaftesbury in exhibiting the social affections as no less natural than the appetites and desires which tend directly to self-preservation; then reviving the Stoic view of the primum naturae, the first objects of natural appetites, he argues that pleasure is not the primary aim of the impulses. However, Shaftesbury also argues for the self-affection, but rather a result which follows upon their attaining their natural ends. We have, in fact, to distinguish self-love, the "general desire that every man hath of his own happiness" or pleasure, from the particular affections, passions, and appetites directed towards objects other than pleasure, in the satisfaction of which pleasure consists. The latter are "necessarily presupposed" as distinct impulses in "the very idea of an interested pursuit"; since, if there were no such pre-existing desires, there would be no pleasure for self-love to aim at. Thus the object of hunger is not the pleasure of eating but food; hunger is therefore, strictly speaking, no more "interested" than benevolence; granting that the pleasures of the table are an important element in the happiness at which self-love aims, the same at least may be said for the pleasures of love and sympathy. Further, so far from bodily appetites (or other particular desires) being forms of self-love, there is no one of them which under certain circumstances may not come into conflict with it. Indeed, it is common for men to sacrifice to passion what they know to be their true interests; at the same time we do not consider such conduct "natural" in man as a rational being; we rather regard it as natural for him to govern his transient impulses. Thus the notion of natural unregulated egoism turns out to be a psychological chimera. Indeed, we may say that an egoist must be doubly self-regulative, since rational self-love ought to restrain not only other impulses, but itself also; for as happiness is made up of feelings that result from the satisfaction of impulses other than self-love, any over-development of the latter, enfeebling these other impulses, must proportionally diminish the happiness at which self-love aims. If, then, it be admitted that human impulses are naturally under government, the natural claim of conscience or the moral faculty to be the supreme governor will hardly be denied.

But has not self-love also, by Butler's own account, a similar authority, which may come into conflict with that of conscience? Butler fully admits this, and, in fact, grounds on it an important criticism of Shaftesbury. We have seen that in the latter's system the "moral sense" is not absolutely required, or at least is necessary only as a substitute for enlightened self-regard; since if the harmony between prudence and virtue, self-regarding and social impulses, is complete, mere self-interest will prompt a duly enlightened mind to maintain precisely that "balance" of affections in which goodness consists. But to Butler's more cautious mind the completeness of this harmony did not seem sufficiently demonstrable to be taken as a basis of moral teaching; he has at least to contemplate the possibility of a man being convinced of the opposite; and he argues that unless we regard conscience as essentially authoritative—which is not implied in the term "moral sense"—such a man is really bound to be vicious; "since interest, one's own happiness, is a manifest obligation.

Still on this view, even if the authority of conscience be asserted, we seem reduced to an ultimate dualism of our rational nature. Butler's ordered polity of impulses turns out to be a polity with two independent governments. Butler does not deny this, so far as mere claim to authority is concerned; but he maintains that the "accuracy of the universal moral sense of honour, is perhaps most creditably anticipated in Wollaston's Religion of Nature Delineated (1722). Here, for the first time, we find "moral good" and "natural good" or "happiness" treated separately as two essentially distinct objects of rational pursuit and investigation; the harmony between them being regarded as matter of religious faith, not moral knowledge. Wollaston's theory of moral evil as consisting in the practical contradiction of a true proposition, closely resembles the most paradoxical part of Clarke's doctrine, and was not likely to approve itself to the strong common sense of Butler; but his statement of happiness or pleasure as a "justly desirable" end at which every rational being "ought" to aim corresponds exactly to Butler's conception of self-love as a naturally governing impulse; while the "moral arithmetic" with which he compares pleasures and pains, and endeavours to make the notion of happiness quantitatively precise, is an anticipation of Benthamism.

There is another side of Shaftesbury's harmony which Butler was ultimately led to oppose in a more decided manner,—the opposition, namely, between conscience or the moral sense and the social affections. In the Sermons, indeed (1729), Butler seems to treat conscience and calm benevolence as permanently allied though distinct principles, but in the Dissertation on Virtue, appealed to the Antalogy (1730), he maintains that the conduct dictated by conscience will often differ widely from that to which mere regard for the production of happiness would prompt. We may take this latter treatise as representing the first in the development of English ethics, at which what were afterwards called "utilitarian" and "intentional" morality were first formally opposed; in earlier systems the antithesis is quite latent, as we have incidentally noticed in the case of Cumberland and Clarke. The argument in Butler's dissertation was probably directed chiefly against Hutcheson, who in his Inquiry Hutchesson into the Original of our Ideas of Beauty and Virtue (1717) had identified vice with the "sensations of pleasure", though his identification is strictly qualified in Hutcheson's posthumously published System of Moral Philosophy (1755), in which the general view of Shaftesbury is more fully developed, with several new psychological distinctions, including Butler's separation of "calm" benevolence—as well as, after Butler, "calm self-love"—from the "turbulent" passions, selfish or social. Hutcheson follows Butler again in laying stress on the regulating and controlling function of the moral sense; but he still regards "kind affections" as the principal objects of moral approbation—the "calm" and "extensive" affections being preferred to the turbulent and narrow—together with the desire and love of moral excellence which is ranked with universal benevolence, the two being equally worthy and necessarily harmonious. Only in a secondary sense is approval due to certain "abilities and dispositions immediately connected with virtuous affections," as candour, veracity, fortitude, sense of honour; while in a lower grade still are placed sciences and arts, along with even bodily skills and gifts; indeed, the approbation we give to these is not strictly moral, but is referred to the "sense of decency or dignity," which (as well as the sense of honour) is to be distinguished from

1. In a remarkable passage near the close of his eleventh sermon Butler seems even to allow that conscience would have to give way to self-love, if it were possible (which it is not) that the two should come into ultimate and irreconcilable conflict.
the moral sense. Calm self-love Hutcheson regards as morally indifferent; though he enters into a careful analysis of the elements of happiness, in order to show that a true regard for private interest always coincides with the moral sense and with benevolence. To this understanding of the fundamental doctrine of the fundamental doctrine of the public and private good, Hutcheson is still more careful to establish the strict disinterestedness of benevolent affections. Shaftesbury had conclusively shown that these were not in the vulgar sense selfish; but the very stress which he lays on the pleasure inseparable from their exercise suggests a subtle egotistic theory which he does not expressly exclude, since it may be said that this "intrinsic reward" constitutes the real motive of the benevolent man. To this, however, this Hutcheson object that in the exquisite delight of the emotion of love is a motive to sustain and develop it; but this pleasure cannot be directly obtained, any more than other pleasures, by merely desiring it; it can be sought only by the indirect method of cultivating and indulging the disinterested desire for others' good, which is thus obviously distinct from the desire for the pleasure of benevolence. He points to the fact that the immumity of death often intensifies instead of diminishing a man's desire for the welfare of those he loves, as a crucial experiment proving the disinterestedness of love; adding, as confirmatory evidence, that the sympathy and admiration commonly felt for self-sacrifice depends on the belief that it is something different from refined self-seeking.

It remains to consider how, from the doctrine that affection is the proper object of approbation, we are to deduce moral rules or "natural laws" prescribing or prohibiting outward acts. It is obvious that all actions conducive to the general good will deserve our highest approbation if done from disinterested benevolence; but how if they are not so done? In answering this question, Hutcheson avails himself of the scholastic distinction between "material" and "formal" goodness. "An action," he says, "is materially good when in fact it tends to the interest of the system, so far as we can judge of its tendency, or to the good of some part consistent with that of the system, whatever were the affections of the agent. An action is formally good when it flowed from good affection in a just proportion." On the point of this distinction Hutcheson turns round from the point of view of Shaftesbury to that of later utilitarianism. As regards "material" goodness of actions, he adopts explicitly and unreservedly the formula afterwards taken as fundamental by Bentham; holding that "that action is best which procures the greatest happiness for the greatest numbers, and the worst which in a like manner occasions misery." Accordingly his treatment of external rights and duties, though inferior in methodical clearness and precision, does not differ in principle from that of Paley or Bentham, except that he lays greater stress on the immediate conduciveness of actions to the happiness of individuals, and more often refers in a merely supplementary or restrictive way to their tendencies in respect of general happiness. It may be noticed, too, that he still accepts the "social compact" as the natural mode of constituting government, and regards the obligations of subjects to civil obedience as normally dependent on a tacit contract; though he is careful to state that consent is not absolutely necessary to the just establishment of beneficent government, nor the source of irrerevocable obligation to a pernicious one.

An important step further in political utilitarianism was taken by Hume in his Treatise on Human Nature (1739). Hume conceives that a compact is the natural means of peacefully instituting a new government, and may therefore be properly regarded as the ground of allegiance to it at the outset; but he urges that, when once it is firmly established the duty of obeying it rests on precisely the same combination of private and general interests as the duty of keeping promises; it is therefore absurd to base the former on the latter. Justice, veracity, fidelity to compacts and to governments, are all co-

ordinate; they are all "artificial" virtues, due to civilization, and not belonging to man in his "ruder and more natural" condition; our approbation of all alike is founded on our perception of their useful consequences. It is this last position that Hume, in his Principles of Human Nature, makes the foundation of his ethical doctrine and Hume's. The former, while accepting utility as the criterion of "material goodness," had adhered to Shaftesbury's view that dispositions, not results of action, were the proper object of moral approval; at the same time, while giving to benevolence the first place in his account of personal merit, he had shrunken from the paradox of treating it as the sole virtue, and had added a rather undefined and unexplained train of qualities, veracity, fortitude, industry, sagacity, immediately approved in various degrees by the "moral sense" or the "sense of dignity." This naturally suggested to a mind like Hume's, anxious to apply the experimental method to psychology, the problem of reducing these different elements of personal merit— or rather our approval of them—to some common principle. The old theory that referred this approval entirely to self-love, is, he holds, easy to disprove by "crucial experiments" on the play of our moral sentiments; rejecting this, he finds the required explanation in the sympathetic pleasure that attends our perception of the conduciveness of virtue to the interests of human beings other than ourselves. He endeavours to establish this inductively by a survey of the qualities, commonly praised as virtues, which he finds to be always either useful or immediately agreeable, either (1) to the virtuous agent himself or (2) to others. In class (2) he includes, besides the Benevolence of Shaftesbury and Hutcheson, the useful virtues, Justice, Veracity and Fidelity to compacts; as well as such immediately agreeable qualities as politeness, wit, modesty and even cleanliness. The most original part of his discussion, however, is concerned with qualities immediately useful to their possessor. The most cynical man of the world, he says, with whatever "sullen incredulity," he may repudiate virtue as a hollow pretence, cannot really refuse his approbation to "discretion, caution, enterprise, industry, frugality, economy, good sense, prudence, discernment;" nor again, to "temperance, sobriety, patience, perseverance, considerateness, secrecy, order, insinuation, address, presence of mind, quickness of conception, facility of expression." It is evident that the merit of these qualities in our eyes is chiefly due to our perception of their tendency to serve the person possessed of them; so that the cynic in praising them is really exhibiting the unselsh sympathy of which he doubts the existence. Hume admits the difficulty that arises when deciding, especially in the case of the "artificial" virtues, such as justice, &c., from the undeniable fact that we praise them and blame their opposites without consciously reflecting on useful or pernicious consequences; but considers that this may be explained as an effect of "education and acquired habits."

So far the moral faculty has been considered as contemplative rather than active; and this, indeed, is the point of view from which Hume mainly regards it. If we ask what actual motive we have for virtuous conduct, Hume's answer is not quite clear. On the one hand, he speaks of moral approbation as derived from "humanity and benevolence," while expressly recognizing, after Butler, that there is a strictly disinterested element in our benevolent impulses (as also in hunger, thirst, love of fame and other passions). On the other hand, he does not seem to think that moral sentiment or "taste" can become a motive to action, except as it "gives pleasure or pain, and thereby constitutes happiness or misery." It is difficult to make these views quite consistent; but at any rate Hume emphatically maintains that "reason is no motive to action," except so far as it "directs the impulse received from appetite or inclination;"
and recognizes—in his later treatise at least—no "obligation" to virtue, except that of the agent's interest or happiness. He attempts, however, to show, in a summary way, that all the duties which his moral theory recommends are also "the true interest of the individual,"—taking into account the importance to his happiness of "peaceful reflection on one's own conduct." Smith considers the maxim of "Shame is the effective means of a particular kind of pleasurable emotion, there is an obvious question suggested by Hume's theory, to which he gives no adequate answer. If the essence of "moral taste" is sympathy with the pleasure of others, why is not this specific feeling excited by other things beside virtue that tend to cause such pleasure? On this point Hume contents himself with the vague remark that "there are a number of sets of passions and sentiments, of which the acting rational beings are by the original constitution of nature the only proper objects." The truth is, then Hume's notion of moral approbation was very loose, as is sufficiently shown by the list of "useful and agreeable" qualities which he considers worthy of approbation.\(^1\) It is therefore hardly surprising that his theory should leave the specific quality of the moral sentiments a fact still needing to be explained. An original and ingenious solution of this problem was offered by his contemporary Adam Smith, in his *Theory of Moral Sentiments* (1759). Smith, in fact, in some measure directly or indirectly anticipates the great sympathy of the perceived or inferred effects on the feelings of and for the agent whose sympathy he yet holds that the essential part of common moral sentiment is constituted rather by a more direct sympathy with the impulses that prompt to action or expression. The spontaneous play of this sympathy he treats as an original and inexplicable fact of human nature, but he considers that its action is powerfully sustained by the pleasure that each man finds in the accord of his feelings with another's. By means of this primary element, compounded in various ways, Adam Smith explains all the phenomena of the moral consciousness. He takes first the semi-moral notion of "propriety" or "decorum," and endeavours to show inductively that our application of this notion to the social behaviour of another is determined by our degree of sympathy with the feeling expressed in such behaviour. Thus the prescriptions of good taste in the expression of feeling may be summed up in the principle, "reduce or raise the expression to that with which spectators will sympathize." When the effort to restrain feeling is exhibited in a degree which surprises as well as pleases, it excites admiration as a virtue or excellence; such excellences Adam Smith quaintly calls the "awful and respectable," contrasting them with the "amiable virtues" which consist in the opposite effort to sympathize, when exhibited in a remarkable degree. From the sentiment of respect and admiration we proceed to the sense of merit and demerit. Here a more complex principle presents itself for analysis; we have to distinguish in the sense of merit—(1) a direct sympathy with the sentiments of the agent, and (2) an indirect sympathy with the gratitude of those who receive the benefit of his actions. In the case of demerit there is a direct antipathy to the feelings of the misdoer, but the chief sentiment excited is sympathy with those injured by the misdeed. The object of this sympathetic resentment, impelling us to punish, is what we call injustice; and thus the reasonable stringency of the obligation to act justly is explained, since the recognition of any action as unjust involves the admission that it may be forcibly obstructed or punished. Moral judgments, then, are expressions of the complex normal sympathy of an impartial spectator with the active impulses that prompt to and result from actions. In the case of our own conduct what we call conscience is really sympathy with the feelings of an imaginary impartial spectator.

Adam Smith gives authority to his moral system by saying that "moral principles are justly to be regarded as the laws of the Deity;" but this he never proves. So Hume insists emphatically on the "reality of moral obligation"; but it is found to mean no more by this than the real existence of the likes and dislikes that human beings feel for each other's qualities. The fact is that amid the analysis of feelings aroused by the moral sentiments the essential questions "What is right?" and "Why?" had been allowed to drop into the background, and the consequent danger to morality was manifest. The binding force of moral rules becomes evanescent if we admit, with Hutcheson, that the "sense" of them may properly vary from man to man as the palate does; and it seems only another way of putting Hume's doctrine, that reason is not concerned with the ends of action, to say that the more existence of a moral sentiment is in itself no reason for obeying it. A reaction, in one form or another, against the tendency to dissolve ethics into psychology was inevitable; since mankind generally could not be so far absorbed by the interest of psychological hypothesis as to forget their need of establishing practical principles. It was obvious, too, that this reaction might take place in either of the two lines of thought; which, having been peacefully allied in Clarke and Cumberledge, had become distinctively opposed to each other in Butler and Hutcheson. It might rather fall back on the two principles commonly accepted, and, affirming their objective validity, endeavour to exhibit them as a coherent and complete set of ultimate ethical truths; or it might take the utility or conduciveness to pleasure, to which Hume had referred for the origin of most sentiments, as an ultimate end and standard by which these sentiments might be judged and corrected. The former is the line adopted with substantial agreement by Price, Reid, Stewart, and other members of the still existing Intuition school; the latter method, with considerably more divergence of view and treatment, was employed independently and almost simultaneously by Paley and Bentham in both ethics and politics, and is at the present time widely maintained under the name of Utilitarianism.

Price's Review of the Chief Questions and Difficulties of Morals was published in 1757, two years before Adam Smith's treatise: In regarding moral ideas as derived from the "intuition of truth or immediate discernment of the nature of things by the understanding," Price revives the general view of Cudworth and Clarke; but with several specific differences. Firstly, his conception of "right" and "wrong" as "single ideas" incapable of definition or analysis—the notions "right," "good," "ought," "duty," "obligation," being coincident or at least least, and confounds the confusions into which Clarke and Wollaston had been led by pressing the analogy between the ethical and physical truth. Secondly, the emotional element of the moral consciousness, on which attention had been concentrated by Shaftesbury and his followers, though distinctly recognized as accompanying the intellectual intuition, is carefully subordinated to it. While right and wrong, in Price's view, are "real objective qualities" of actions, moral "beauty and deformity" are subjective ideas; representing feelings which, partly the necessary effects of the perceptions of right and wrong in rational beings as such, partly due to an "implanted sense" or varying emotional susceptibility. Thus, both reason and sense of instinct co-operate in the impulse to virtuous conduct, though the rational element is primary and paramount. Price further follows Butler in distinguishing the perception of merit and demerit in agents as another accomplishment of the perception of right and wrong in actions; the former being, however, one particular species of the latter, since, to perceive right and any one is to perceive that it is right to reward him. It is to be observed that both Price and Reid are careful to state that the merit of the agent depends entirely on the intention or "formal rightness" of his act; a man is not blameworthy for unintended evil, though he may of course be blamed for any wilful neglect (cf. Arist., *Eth. Nic.*, iii. 1), which has caused him to be ignorant of his real duty. When we turn to the subject matter of virtue, we find that Price, in comparison with More and Clarke, is decidedly

\(^1\) In earlier editions of the *Inquiry Hume* expressly included all approved qualities under the general notion of "virtue." In later editions he avoided this strain on usage by substituting or adding "merit" in several passages—allowing that some of the abovementioned qualities which he mentions would be more commonly called "talents," but still maintaining that there is little distinction made in the termical estimation of "virtue" and "talents."
labour, skill, preservative care; though actual rights of property depend on the general utility of conforming to the law of the land by which they are determined. We observe, however, that Paley's main point in school even mixed utilitarian reasons that benefited the alien and older manner of thought; as when he supports the claim of the poor to charity by referring to the intention of mankind "when they agreed to a separation of the common fund," or when he infers that monogamy is a part of the divine design from the equal numbers of males and females born. In other cases his statement of utilitarian considerations is fragmentary and unmethodical, and tends to degenerate into loose consideration rather than mixed topics.

In unity, consistency and thoroughness of method, Bentham's utilitarianism has a decided superiority over Paley's. He considers actions solely in respect of their pleasurable and painful consequences, expected or actual; and he recognizes the need of making a systematic register of these consequences, free from the influences of common moral opinion, as expressed in the "eulogistic" and "dyslogistic" terms in common use. Further, the effects that he estimates are all of a definite, palpable, empirically ascertainable quality; they are such pleasures and pains as most men feel and all can observe, so that all his political or moral inferences lie open at every point to the test of practical experience. One example, it would seem, can tell what value he sets on the pleasures of alimentation, sex, the senses generally, wealth, power, curiosity, sympathy, antipathy (malevolence), the gifts of individuals or of states, as standards from the corresponding pains, as well as the pains of labour and organic disorders; and can guess the rate at which they are valued by others; therefore if it be once granted that all actions are determined by pleasures and pains, and are to be tried by the same standard, the art of legislation and private conduct is apparently placed on an empirical basis. Bentham, no doubt, seems to go beyond the limits of experience proper in recognizing "religious" and "political" utilities, and "social" and "moral" pleasures; but the truth is that he does not seriously take account of them, except in so far as religious hopes and fears are motives actually operating, which therefore admit of being observed and measured as much as any other motives. He does not himself use the will of an omnipotent and benevolent being as a means of logically connecting individual and general happiness. He has no regard for the discussion of the nature of value, the nature of the "good," apart from the useful, as is sometimes done by the utilitarian school. He puts the usefulness on a plane with the goodness, and is content with the conclusions drawn from the laws

By the law of Association in which Paley's position is involved; but this gain is dearly purchased. For in answer to the question that immediately arises, How then are the sanctions of the moral rules which it will most conduce to the general happiness for men to observe, shown to be always adequate in the case of all the individuals whose observance is required? he is obliged to admit that "the only interests which a man is at all times sure to find adequate motives for consulting are his own." Indeed, in many parts of his work, in the department of legislative and constitutional theory, it is rather assumed that the interests of some men will continually conflict with those of their fellows, unless we alter the balance of prudential calculation by a readjustment of penalties. But on this assumption a system of private conduct on utilitarian principles cannot be constructed until legislative and constitutional reform has been perfected. And, in fact, "private ethics," as conceived by Bentham, does not exactly expound such a system; but rather exhibits the coincidence, so far as it extends, between private and general happiness, in that part of each man's conduct that lies beyond the range of useful legislation. It was not his place, as a practical philanthropist, to dwell on the defects in this coincidence; and since what men generally expect from a moralist is a completely

This list gives twelve out of the fourteen classes in which Bentham arranges the springs of action, omitting the religious passion (mentioned afterwards), and the pleasures and pains of self-interest, which include all the other classes except sympathy and antipathy. The part of the "Dilemmas" published by Bowring from MSS. left after Bentham's death, the coincidence is asserted to be complete.

reasoned account of what they ought to do, it is not surprising that some of Bentham's disciples should have either ignored or endeavoured to supply the gap in his system. One section of his school made a protest against the other circumscriptions of the utilitarianism that a man always gains his own greatest happiness by promoting that of others; another section, represented by John Austin, apparently returned to Paley's position, and treated utilitarian morality as a code of divine legislation; others, with Grote, are content to abate the severity of the claims made by "general happiness" on the individual, and to consider utilitarian duty as practically limited by reciprocity; while others, on the opposite side an unqualified submission of private to general happiness was advocated by J. S. Mill, who did more than any other member of the school to spread and popularize utilitarianism in ethics and politics.

The fact is that there are several different ways in which a utilitarian system of morality may be used, without deciding whether the sanctions attached to it are always adequate. (1.) It may be presented as practical guidance to all who choose "general good" as their ultimate end, whether they do so on religious grounds, or through the predominance in their minds of impartial sympathy, or because their conscience acts in harmony with utilitarian principles, or for any combination of these or any other reasons; or (2) it may be offered as a code to be obeyed not absolutely, but only so far as the coincidence of private and general interest may in any case be judged to extend; or again (3) it may be used for the guidance by which men may reasonably agree to praise and blame the conduct of others, even though they may not always think fit to act on it. We may regard morality as a kind of supplementary legislation, supported by public opinion, which we may expect the public, when duly enlightened, to frame in accordance with the public interest. Still, even from this point of view, which is that of the legislator or social reformer rather than the moral philosopher, our code of duty must be greatly influenced by our estimate of the degree in which men are normally influenced by self-regard (in its ordinary sense of regard for interests not sympathetic) and by sympathy or benevolence, and of the range within which sympathy may be expected to be generally effective. Thus, for example, the moral standard for which a utilitarian will reasonably endeavour to gain the support of public opinion must be essentially different in quality, according as he holds with Bentham that nothing but self-regard will "satisfy" a "decent benevolence" is a very valuable addition;" or as J. S. Mill that the public spirit should be the prominent motive in the performance of all socially useful work, and that even hygienic precepts should be inculcated, not chiefly on grounds of prudence, but because "by squandering our health we disable ourselves from rendering services to our fellow-creatures."

Not less important is the interval that separates Bentham's polemical attitude towards the moral sense, from Mill's conciliatory position, that "the mind is not in a state formable to utility unless it loves virtue as a thing desirable in itself." Such love of virtue Mill holds to be in a sense natural, though not an ultimate and inexplicable fact of human nature; it is to be explained by the "Law of Association" of feelings and ideas, through which objects originally desired as a means to some further end come to be directly pleasant or desirable. Thus, the miser first sought money as a means to comfort, but ends of by sacrificing comfort to money; and similarly though the first promptings to justice (or any other virtue) spring from the non-moral pleasures gained or pains avoided by it, through the link formed by repeated virtuous acts the performance of them ultimately comes to have that immediate satisfaction attached to it which we distinguished as moral. Indeed, the acquired tendency to virtuous conduct may become so strong that the habit of willing it may continue, "even when the reward which

It should be observed that Austin, after Bentham, more frequently uses the term "moral" to connote what he more distinctly and positively, negative morality," the code of rules supported by common opinion in any society.
the virtuous man receives from the consciousness of well-doing is anything but an equivalent for the sufferings he undergoes or the wishes he may have renounced. It is thus that the before-mentioned self-sacrifice of the moral hero is conceived by Mill to be possible and actual. The moral sentiments, on this view, are not phases of self-love as Hobbes held; nor can they be directly identified with sympathy, either in Hume's way or in Adam Smith's; in fact, though apparently simple they are really derived in a complex manner from self-love and sympathy combined with more primitive impulses. Justice (e.g.) is regarded by Mill as essentially resentment moralised by enlarged sympathy and an interest in the happiness of one's fellowmen. What we mean by injustice is harm done to an assignable individual by a breach of some rule for which we desire the violator to be punished, for the sake both of the person injured and of society at large, including ourselves. As regards moral sentiments generally, the view suggested by Mill is more definitely given by the chief living representative of the associationist school, Alexander Bain; by whom the distinctive characteristics of conscience are traced to "education under government or authority," though prudence, disinterested sympathy and other emotions combine to swell the mass of feeling vaguely denoted by the term moral. The combination of antecedents is somewhat differently given by different writers; but all agree in representing the conscience of any individual as naturally correlated to the interests of the community of which he is a member, and thus a natural ally in enforcing utilitarian rules, or as a reliable guide when utilitarian calculations are difficult and uncertain.

This substitution of hypothetical history for direct analysis of the moral sense is really older than the utilitarianism of Paley and Bentham, which it has so profoundly modified. The effects of association in modifying mental phenomena were noticed by Locke, and made a cardinal point in the metaphysic of Hume; who also referred to the principle slightly in his account of justice and other "artificial" virtues. Some years earlier, Gay, admitting Hutcheson's proof of the actual disinterestedness of moral and benevolent impulses, had maintained that these (like the desires of knowledge or fame, the delight of reading, hunting and plating, &c.) were derived from self-love by the "power of association." But a thorough and systematic application of the principle to ethical psychology is first found in Hartley's Observations on Man (1748). Hartley, too, was the first to consider self-interest as producing mental phenomena, a quasi-chemical combination of these into a compound apparently different from its elements. He shows elaborately how the pleasures and pains of "imagination, ambition, self-interest, sympathy, theopahy, and the moral sense" are developed out of the elementary pleasures and pains of sensation; by the confluence into really complex but apparently single ideas of the "miniatures" or faint feelings which the repetition of sensations contemporaneously or in immediate succession tend to produce in cohering groups. His theory assumes the correspondence of mind and body, and is applied pari passu to the formation of ideas from sensations, and of "compound vibrations in the medullary substance" from the original vibrations that arise in the organ of sense.

The same general view was afterwards developed with much vigour and clearness on the psychical side alone by James Mill in his Analysis of the Human Mind. The whole theory has been persistently controverted by writers of the intuitional school, who (unlike Hartley) have usually thought that this derivation is 1 in the before-mentioned dissertation. Cf. note 2 to p. 835. Hartley refers to this treatise as having supplied the starting-point for his own sym.

1. It should be noticed that Hartley's sensationalism is far from leading him to exalt the corporeal pleasures. On the contrary, he takes an almost analytic unity that there is nothing in the imagination, ambition, self-interest) cannot be made an object of primary pursuit without a loss of happiness on the whole—of one of his arguments being that these pleasures occur earlier in time, and at that which is probably the order of nature is always less perfect than that which is posterior.

of moral sentiments from more primitive feelings would be detrimental to the authority of the forms. The chief argument against this theory has consisted on the part of some which these sentiments are manifested by children, which hardly allows time for association to produce the effects ascribed to it. This argument has been met in recent times by the application to mind of the physiological theory of heredity, according by which changes produced in the mind (brain) of a parent, by association of ideas or otherwise, tend to be inherited by its offspring; so that the development of the moral sense or any other faculty or susceptibility of existing man may be hypothetically carried back into the prehistoric life of the human race, without any change in the manner of derivation supposed. At present, however, the theory of heredity is usually held in conjunction with Darwin's theory of natural selection; according to which different kinds of living things in the course of a series of generations come gradually to be endowed with organs, faculties and habits tending to the preservation of the individual or species under the conditions of life in which it is placed. Thus we have a new useful factor in the history of the moral sentiments; which, though in no way opposed to the older psychological theory of their formation through coalescence of more primitive feelings, must yet be conceived as controlling and modifying the effects of the law of association by preserving the formation of sentiments other than those tending to the preservation of human life. The influence of the Darwinian theory, moreover, has extended from historical psychology to moral psychology. It is not surprising to find that "preservation of species" and "social conditions of existence" fore "happiness" as the ultimate end and standard of virtue.

Before concluding this sketch of the development of English ethical thought from Hobbes to the thinkers of the 19th century, it will be well to notice briefly the views held by different moralists on the question of free-will—so far, that is, as they have been put forward as ethically important. We must first distinguish three meanings in which "freedom" is attributed to the will or "inner self" of a human being, viz. (1) the general power of choosing among different alternatives of action without a motive, or against the resultant force of conflicting motives; (2) the power of choice between the promptings of reason and those of appetites (or other non-rational impulses) when the latter conflict with reason; (3) merely the quality of acting rationally in spite of conflicting impulses, however strong, the non passus of the medieval theologians. It is obvious that "free-will" is a term which is used in a variety of senses, and that under this determination; and, indeed, is rather an ideal state after which the moral agent ought to aspire than a property which the human will can be said to possess. In the first sense, again, as distinct from the second, the assertion of "freedom" has no ethical significance, except in so far as it introduces a general uncertainty into our inferences respecting human conduct. Even in the second sense it hardly seems that the freedom of a man's will can be an element to be considered in examining what it is right or best for him to do (though of course the clearest convictions of duty will be fruitful if a man has not sufficient self-control to enable him to act on them); it is rather when we ask whether it is just to punish him for wrong-doing that it seems important to know whether he could have done otherwise. But in spite of the strong interest taken in the theological aspect of this question by the Protestant divines of the 17th century, it does not appear that English moralists from Hobbes to Hume laid any stress on the relation of free-will either to duty generally or to justice in particular. Neither the doctrine of Hobbes, that deliberation is a mere alternation of competing desires, voluntary action immediately following the "last appetite," nor the hardly less decided Determinism of Locke, who held that the will is always moved by the greatest present uneasiness, appeared to either author to require any reconciliation with the belief in human responsibility. Even in Clarke's system, where Indeterminism is no doubt a cardinal doctrine, its importance is metaphysical.
rather than ethical; Clarke's view being that the apparently arbitrary particularity in the constitution of the cosmos is really only explainable through the concept of free will. The emphasis of Shaftesbury and sentimental moralists generally question this view naturally out of sight; and the cautious Butler tries to exclude its perplexities as far as possible from the philosophy of practice. But since the reaction, led by Price and Reid, against the manner of philosophizing that had culminated in Hume, free-will has been generally maintained by the intuitive school to be an essential point of ethics; and, in fact, it is naturally connected with the judgment of good and ill deserts which these writers give as an essential element in their analysis of the moral consciousness. An irresistible motive, it is forcibly said, palliates or takes away guilt; no one can blame himself for yielding to necessity, and no one can properly be punished for what he could not have prevented. In answer to this argument some necessarians have admitted that punishment can be legitimate only if it be beneficial to the person punished; others, again, have held that the lawful use of force is to restrain lawless force; but most of those who reject free-will defend punishment on the ground of its utility in deterring others from crime, as well as in correcting or restraining the criminal on whom it falls.

In the preceding sketch we have traced the course of English ethical speculation without bringing it into relation with contemporary European thought on the same subject. And in fact almost all the systems described, from inclusive to descending and subordinate, have assumed a more or less growth, showing hardly any traces of foreign influence. We may observe that ethics is the only department in which this result appears. The physics and psychology of Descartes were much studied in England, and his metaphysical system was certainly the most important antecedent of Locke's; but Descartes hardly touched ethics proper. So again the controversy that Clarke conducted with Spinoza, and afterward with Leibnitz, was entirely confined to the metaphysical region. Catholic France was a school for Englishmen in many subjects, but not in morality; the great struggle between Jansenists and Jesuits had a very remote interest for them. It was not till near the close of the 18th century that the impress of the French revolutionary philosophy began to manifest itself in England; and even then its influence was mostly political rather than ethical. It is striking to observe how even in the case of writers such as Coleridge, who were most powerfully affected by the French political movement, the moral basis, on which the new social order of rational and equal freedom is constructed, is almost entirely of native origin; even when the tone and spirit are French, the forms of thought and manner of reasoning are still purely English. In the derivation of Benthamism alone—which, it may be observed, first becomes widely known in the French phraseology of Dumont—an important element is supplied by the works of a French writer, Helvétius; as modifying element. This influence, so far as it has affected moral as distinct from political speculation, has been exercised in several different directions. In the doctrine of progress, which in Comte's view, consists in the ever-growing preponderance of the distinctively human attributes over the purely animal, social feelings being ranked highest among human attributes, and highest of all the most universalized phase of human affection, the devotion to humanity as a whole. Accordingly, it is the development of benevolence in man, and of the habit of "living for others," which Comte takes as the ultimate aim and standard of practice, rather than the mere increase of happiness. He holds, indeed, that the two are inseparable, and that the more altruistic any man's sentiments and habits of action can be made, the greater will be the happiness enjoyed by himself as well as by others. But he does not seriously trouble himself to argue with egoism, or to weigh carefully the amount of happiness that might be generally attained by the satisfaction of egoistic propensities duly regulated; a supreme unquestioning self-devotion, in which all personal calculations are suppressed, is an essential feature of his moral ideal. Such a view is almost diametrically opposed to Bentham's conception of normal human existence; the newer utilitarianism of Mill represents an endeavour to find the right middle path between the two extremes.

It is to be observed that, in Comte's view, devotion to humanity is the principle not merely of morality, but of religion; i.e., it should not merely be practically predominant, but should be maintained in an absolutely regular and constant form of expression, private and public. This side of Comte's system, however, and the details of his ideal reconstruction of society, in which this religion plays an important part, have had but little influence either in England or elsewhere. It is more important to notice the general effect of his philosophy on the method of determining the particulars of morality as well as of law (as it ought to be). In the utilitarianism of Paley and Bentham the proper rules of conduct, moral and legal, are determined by comparing the imaginary consequences of different modes of regulation on men and women, conceived as specimens of a substantially uniform and unchanging type. It is true that Bentham expressly recognizes the varying influences of climate, race, religion, government, as considerations which it is important for the legislator to take into account; but his own work of social construction was almost entirely independent of this. In his school, as a small and legal, are convinced of their competence to solve all important ethical and political questions for human beings of all ages and countries, without regard to their specific differences. But in the Comtian conception of social science, of which ethics and politics are the practical application, the knowledge of the laws of the evolution of society is of fundamental and continually increasing importance; humanity is regarded as having passed through a series of stages, in each of which a somewhat different set of laws and institutions, customs and habits, is normal and appropriate. Thus present man is a being that can only be understood through a knowledge of his past history; and any effort to construct for him a moral and political ideal, by a purely abstract and un-historical method, must necessarily be futile; whatever modifications may at any time be desirable in positive law and morality can only be determined by the aid of "social dynamics." This view extends far beyond the limits of Comte's special school or sect, and has been widely accepted.

When we turn from French philosophy to German, we find the influence of the latter on English ethical thought almost insignificant until a very recent period. In the 17th century, indeed, the treatise of Pufendorf on the Law of Nature, in which the general view of Grotius was stated with modifications, partly designed to effect a compromise with the doctrine of Hobbes, seems to have been a good deal read at Oxford and elsewhere. "Locke includes it among the books necessary to the complete education of a gentleman. But the subsequent development of the theory of conduct in Germany dropped almost entirely out of the cognizance of
Englishmen; even the long dominant system of Wollf (d. 1754) was hardly known. Nor had Kant any serious influence in England—until the second quarter of the 19th century. We find, however, distinct traces of Kantian influence in Whewell and other writers of the intellectual school, and at a later date it became so strong that its importance on subsequent ethical thought can scarcely be over-estimated. The English moralist with whom Kant has most affinity is Price; in fact, Kantianism, in the ethical thought of modern England, holds a place somewhat analogous to that Kant. Before this position is occupied by the teaching of Price and Reid among English moralists. Kant, like Price and Reid, holds that man as a rational being is unconditionally bound to conform to a certain rule of right, or *categorical imperative* of reason. Like Price he holds that an action is not good unless done from a good motive, and that this motive must be essentially different from natural inclination of any kind; duty, to be duty, must be done for duty’s sake; and he argues, with more subtlety than Price or Reid, that though a virtuous act is no doubt pleasant to the virtuous agent, and any violation of duty painful, this moral pleasure (or pain) cannot strictly be the motive to the act, because it follows instead of preceding the recognition of our obligation to do it.\(^1\) With Price, again, he holds that right of reason and motives is not only an indispensable condition of the rightness of an action, but actually the sole determinant of its moral worth; but with more philosophical consistency consistency he makes the rules of conduct, as distinct from its "formal" rightness, and therefore all duties of duty, so far as universally binding, must admit of being exhibited as applications of the general principle that duty ought to be done for duty’s sake. This makes it the most original part of Kant’s doctrine.

The doctrine of reason, he points out, must go beyond what he calls the *rational:* it is addressed to all rational beings as such; hence, my intention cannot be right unless I am prepared to will the principle on which I act to be a universal law. He considers that this fundamental rule or imperative *act on a maxim which thou canst will to be law universal* supplies a sufficient criterion for determining particular duties in all cases. The rule excludes *wrong* conduct with two degrees of stringency. Some offences, such as making promises with the intention of breaking them, we cannot even conceive universalized; as soon as every one breaks promises no one would care to have promises made to him. Other maxims, such as that of leaving persons in distress to shift for themselves, we can easily conceive to be universal laws, but we cannot without contradiction will them to be such; for when we are ourselves in distress we cannot help desiring that others should help us.

Another important peculiarity of Kant’s doctrine is his development of the connexion between duty and free-will. He holds that it is through our moral consciousness that we know what we are free; in the cognition that I ought to do what is right because it is right and not because I like it, it is implied that this purely rational volition is possible; that my action can be determined, not "mechanically," through the necessary operation of the natural stimuli of pleasure and pain, but in accordance with the laws of my free, reasonable self. The realization of reason, or of human wills so far as rational, thus presents itself as the absolute end of duty; and we get, as a new form of the fundamental practical rule, "act so as to treat humanity, in thyself or any other, as an end always, and never as a means only." We may observe, too, that the notion of freedom connects ethics with jurisprudence in a simple and striking manner. The fundamental aim of jurisprudence is to realize external freedom by removing the hindrances imposed on one’s free action through the interference of other wills. Ethics shows how to realize internal freedom, by intrinsically and extrinsically rational ends in opposition to those of natural inclination. If we ask what precisely are the ends of reason, Kant’s proposition that "all rational beings as such are ends in themselves for every rational being," hardly gives a clear answer. It might be interpreted to mean that the result to be practically sought is simply the development of the rationality of all rational beings—such as men—whom we find to be as yet imperfectly rational. But this is not Kant’s view. He holds, indeed, that each man should aim at making himself the perfect possible instrument of reason; but he expressly denies that the perfection of others can be similarly prescribed as an end to each. It is, he says, "a contradiction to regard myself as in duty bound to promote the perfection of another,... a contradiction to make it a duty for me to do something for another which no other but himself can do."

In what practical sense, then, am I to make other rational beings my ends? Kant’s answer is that what each is to aim at in the case of others is not Perfection; but Happiness, i.e., to help them in such a way that they are not hindered by it, but in which the ends of reason are not by reason, but by natural inclination. He explains also that to seek one’s own happiness cannot be prescribed as a duty, because it is an end to which every man is inevitably impelled by natural inclination: but that just because each inevitably desires his own happiness, and therefore desires that others should assist him in time of need, he is bound to make the happiness of others his ethical end, since he cannot *morally* direct his own action for its own sake. To determine the moral prudential maxim is not duty alone, but happiness combined with moral worth; the demand for happiness as the reward of duty is so essentially reasonable that we must postulate a universal connexion between the two as the order of the universe; indeed, the practical necessity of this postulate is the only adequate rational ground that we have for believing in the existence of God.

Before the ethics of Kant had begun to be seriously studied in England, the rapid and remarkable development of metaphysical view and method of which the three chief stages are represented by Fichte, Schelling and Hegel respectively had already taken place; and the system of the latter was occupying the most prominent position in the philosophical thought of Germany.\(^2\) Hegel’s ethical doctrine (expounded chiefly in his *Philosophie des Rechts*, 1821) shows a close affinity, and also a striking contrast, to Kant’s. He holds, "One in Kantism, as we have partly seen, the most important ontological beliefs—in God, freedom and immortality of the soul—are based on necessities of ethical thought. In Fichte’s system the connection of ethics and metaphysics is still more intimate; indeed, we may compare it in this respect to Platonism; as Plato blends the most fundamental notions of each of these studies in the one idea of the Good, so Fichte blends them in the one idea of free-will. Freedom, as Hegel sees it, is at once the foundation of all being and the end of all moral action. In the systems of Schelling and Hegel ethics falls more naturally into a subordinate perspective which is determined by the idea of the Good. Freedom, as Hegel sees it, is rather suggested than completely developed. Neither Fichte nor Schelling has exercised more than the faintest and most indirect influence on ethical philosophy in England; it therefore seems best to leave the ethical doctrines of each to be explained in context, with the rest of his system."
with Kant, that duty or good conduct consists in the conscious realization of the free reasonable will, which is essentially the same in all rational beings. But in Kant's view the universal content of this will is only given in the formal condition of "only acting as one can desire all to act," to be subjectively applied by each rational agent to his own volition; whereas Hegel conceives the universal will as objectively presented to each man in the laws, institutions and customary morality of the community in which he is a member. "It is the necessary tendency of all natural inclinations towards pleasures, or the desires for selfish, happiness, require to be morally resisted; but even the prompting of the individual's conscience, the impulse to do what seems to him right, if it comes into conflict with the common sense of his community. It is true that Hegel regards the conscious effort to realize one's own conception of good as a higher stage of moral development than the mere conformity to the jural rules establishing property, maintaining contract and allotting punishment to crime, in which the universal will is first expressed; since in such conformity this will is only accomplished accidentally by the outward concurrence of individual wills, and is not essentially realized in any of them. He holds, however, that this conscientious effort is self-deceived and futile, is even the very root of moral evil, except it attains its realization in harmony with the objective social relations in which the individual finds himself. Of these latter Hegel has elaborated, in his views on the state, the family, the secondary social groups, the family, the second by civil society, and the third by the state, the organization of which is the highest manifestation of universal reason in the sphere of practice. Hegelian philosophy appears as a distinct element in modern English ethical thought; but the direct influence of Hegel's system is perhaps less important than that indirectly exercised through the powerful stimulus which it has given to the study of the historical development of human thought and human society. According to Hegel, the essence of the universe is a process of evolution from the abstract to the concrete; and a right understanding of this process gives the key for interpreting the evolution in time of European philosophy. In so far, as his view, the history of mankind is a history of the necessary development of the free spirit through the different forms of political organization: the first being that of the Oriental monarchy, in which freedom belongs to the monarch only; the second, that of the Greek-Roman republics; in which a select body of free citizens is sustained on a basis of slavery; while finally in the modern societies, sprung from the Teutonic invasion of the decaying Roman empire, freedom is recognized as the natural right of all members of the community. The effect of the lectures (ostensibly edited) in which Hegel's "Philosophy of History" and "History of Philosophy" were expounded, has extended far beyond the limits of his special school; indeed, the predominance of the historical method in all departments of the theory of practice is not a little due to their influence. (H. S.; X.)

D. Ethics since 1879.—Ethical controversies, like most other speculative disputes, have, during the latter part of the 19th and the beginning of the 20th century, centred round Darwinian theories. The chief characteristic of English moral philosophy in its previous history has been its comparative isolation from great movements, sometimes contemporary movements, of philosophical or scientific thought. Ethics in England, in the 19th century, was less than on the continent of Europe suffered until the time of Bacon from the excessive domination of theological dogma and the traditional scholastic and Aristotelian philosophy. But the moral philosophy of the 18th century, freed from scholastic trammels, was a genuine native product, arising out of the real problem of conduct and reaching its conclusions, at least ostensibly, by an analysis of, and an appeal to, the facts of conduct and the nature of morality. Even at the beginning of the century which followed the main work of belief and so the Utilitarian school was mainly political, the influence of political theories upon contemporary moral philosophy was upon the whole an influence of which the moral philosophers themselves were unconscious; and from the nature of things moral and political philosophy have a tendency to become one and the same inquiry. Mill, it is true, and Comte both encouraged the idea that society and conduct alike were susceptible of strictly scientific investigation. But the attempt not only to treat ethics scientifically, but actually to subordinate the principles of conduct to the principles of existing biological science or group of sciences biological in character, was reserved for post-Darwinian moral philosophers. That attempt has not, in the opinion of the majority of critics, been successful, and perhaps what is most permanent in the contribution of modern times to ethical theory will ultimately be attributed to philosophers antagonistic to evolutionary ethics. Nevertheless the application of the historical method to inquiries concerning the facts of morality and the moral life—its part of the great movement of thought to which Darwin gave the chief impetus—has caused moral problems to be presented in a novel aspect; while the influence of Darwinism upon studies which have considerable bearing upon ethics, e.g. anthropology or the study of comparative religion, has been incalculable.

The other great movement in modern moral philosophy due to the influence of German, and especially Hegelian, idealism followed naturally for the most part from the revival of interest in metaphysics noticeable in the latter half of the 19th century. But metaphysical systems of ethics are no novelty even in England, and, while the increased interest in ultimate issues of philosophy has enormously deepened the first generation of men's appreciation of moral problems and the issues involved in conduct, the actual advance in ethical theory produced by such speculations has been comparatively slight. What is of lasting importance is the re-affirmation upon metaphysical grounds of the right of the moral consciousness to state and solve its own difficulties, and the successful repulsion of the claims of particular sciences such as biology to include the sphere of conduct within their scope and methods. And both evolutionary and idealistic ethics agree in repudiating the standpoint of narrow individuellism, alike insist upon the necessity of regarding the self as social in character, and regard the end of moral progress as only realizable in a perfect society. It is perhaps too much to hope that the long-continued controversy between hedonists and anti-hedonists has been finally settled. But certainly few modern moral philosophers would be found in the present day ready to defend the crudities of hedonistic psychology as they appear in Bentham and Mill. A certain common agreement has been reached concerning the impossibility of regarding pleasure as the sole motive criterion and end of moral action, though different opinions still prevail as to the place occupied by pleasure in the sumnum bonum, and the possibility of a hedonistic calculus.

The failure of "laissez-faire" individualism in politics to produce that common prosperity and happiness which its advocates hoped for caused men to question the usefulness of which its ethical counterpart was constructed. Similarly the comparative failure of science to satisfy men's aspirations alike in knowledge and, so far as the happiness of the masses is concerned, in practice has been largely instrumental in producing that revolt against material prosperity as the end of conduct which is characteristic of idealist moral philosophy. To this revolt, and to the general tendency to find the principle of as late as the 19th century, has been largely contributed. In the main the appeal to reason has followed the traditional course of such movements in ethics, and has re-affirmed in the light of fuller reflection the moral principles implicit in the ordinary moral consciousness. It is only in the part of field that there are noticeable signs of dissatisfaction with current morality itself, and a tendency to substitute or advocate a new morality based ostensibly upon conclusions derived from the facts of scientific observation.

Darwin himself seems never to have questioned, in the sceptical direction in which his followers have applied his principles, the absolute character of moral obligation. What interested
him chiefly, in so far as he made a study of morality, was the development of moral conduct in its preliminary stages.

Darwin. He was principally concerned to show that in morality, as in other departments of human life, it was not necessary to postulate a complete and abrupt gap between human and merely animal existence, but that the instincts and habits which contribute to survival in the struggle for existence among animals develop into moral qualities which have a similar value for the preservation of human and social life. Regarding the social tendency as originally itself an instinct developed out of parental or filial affection, he seems to suggest that natural selection, which was the chief cause of its development in the earlier stages, may very probably influence the transition from purely tribal and social morality into morality in its later and more complex forms. But he admits that natural selection is not necessarily the only cause, and he refrains from identifying the fully developed morality of civilized nations with the "social instinct." Moreover, he recognizes that qualities, e.g. loyalty and sympathy, which may have been of great service to the tribe in its primitive struggle for existence, may become a positive hindrance to physical efficiency (leading as they do to the preservation of the unfit) at a later stage. Nevertheless he is ready to say that "the idea of leading the harmonious life is the fundamental idea of our nature," and the question which is obviously of vital importance, whether we should obey the dictates of reason, which would urge us only to such conduct as is conducive to natural selection, or remain faithful to the noblest part of our nature at the expense of reason, he leaves unsolved.

It was in Herbert Spencer, the triumphant "buccinator novi temporis," that the advocates of evolutionary ethics found their protagonist. Spencer looked to ideas derived from the biological sciences to provide a solution of all the enigmas of morality, as of most other departments of life; and he conceived it "to be the business of moral science to deduce from the laws of life and the conditions of existence what kinds of action necessarily tend to produce happiness and what kinds to produce unhappiness." It is clear, therefore, that any moral science which is to be of value must wait until the "laws of life" and "conditions of existence" have been satisfactorily determined, presumably by biology and the allied sciences; and there are few more melancholy instances of failure in philosophy than the paucity of the actual results attained by Spencer in his lifetime in his application of the so-called laws of evolution to human conduct—a failure recognized by Spencer himself. His own contribution to ethics was vitiated at the outset by the fact that he never shook himself free from the trammels of the philosophy of which his own work was intended to supersede. He began by disclaiming any affinity to Utilitarianism on the part of his own philosophy. He pointed out that the principle of the greatest happiness of the greatest number is a principle without any definite meaning, since men are nowhere unanimous in their standard of happiness, but regard the conception of happiness rather as a problem to be solved than a test to be applied. Universal happiness would require omniscience to legislate for it and the "normal" or, as some would say, "perfect" man to desire it; neither of these conditions of its realization is at present in existence. Further, the principle that "everybody is to count for one, nobody for more than one," is equally unsatisfactory. It may be taken to imply that the useless and the criminal should be entitled to as much happiness as the useful and the virtuous. While it gives no rule for private as distinct from public conduct, it provides no real guidance for the legislator. For neither happiness nor unhappiness in the abstract can be measured, and the conditions of its realization can be distributed; and in the end "not general happiness becomes the ethical standard by which legislative action is to be guided, but universal justice." Yet the implications of this latter conclusion Spencer never fully thought out. He accepted bodily without further questioning the hedonistic psychology by which the Utilitarians sought to justify their theory while he rejected the theory itself. Good,

e.g. defined by him "as conduct conducive to life," is also further defined as that which is "conducive to a surplus of pleasures over pains." Happiness, again, is always regarded as consisting in feeling, ultimately in pleasant feeling, and there is no attempt to apply the same principles of criticism which he had successfully applied to the Utilitarians' "happiness" to the conception of "conduciveness." And, the sanctity and emphatic character of the Utilitarians the existence of certain fundamental moral intuitions which have come to be quite independent of any present conscious experience of their utility, he yet holds that they are the results of accumulated racial experiences gradually organized and inherited. Finally, side by side with a theory of the nature of moral obligation thus fundamentally empirical and a posteriori in its outlook, he maintains in his account of justice the existence of the "idea of justice as distinct from a mere sentiment, carrying with it an a priori belief in its existence and identical in its a priori and intuitive character with the ultimate criterion of Utilitarianism itself. The fact is that any close philosophical analysis of Spencer's system of ethics can only result in the discovery of a multitude of mutually conflicting and for the most part logically untenable theories. It is frequently impossible to discover whether he wishes by an appeal to evolutionary principles to involve the character and the character of the traditional morality which in the main he accepts without question from the current opinions about conduct of his age, or whether he wishes to discredit and disprove the validity of that morality in order to substitute by the aid of the biological sciences a new ethical code. The argument; for instance, that intuitive and a priori beliefs gain their absolute character from the fact that they are the result of continued transmission and accumulation of past nervous modifications in the history of the race would, if taken seriously, lead us to the belief that ultimate ethical sanctions are to be sought, not by an appeal to the moral consciousness, but by the investigation of brain tissue and the relation of man's bodily organism to its environment. Yet such a view would be totally at variance with much that Spencer says (especially in his treatment of justice) concerning the trustworthiness and inevitable character of men's constant appeal to the intuitions of their moral consciousness. Moreover, the very fact itself of the possibility of inheriting acquired moral characteristics is still hotly debated by those biologists with whom should rest the ultimate verdict. Again, the argument that "conduct is good or bad according as its total effects are pleasurable or painful," and that ultimately "pleasure-giving acts are life-sustaining acts," seems to involve Spencer in a multitude of unverified assumptions and contradictory theories. In the first place it is never clear whether Spencer regards the fact that a particular course of conduct is accompanied by a feeling of pleasure as constituting a life and life-sustaining character, or whether he wishes us to use as our criterion of what is pleasant in conduct the fact that the conduct in question seems conducive to the continued existence of man's organic life. He apparently passes from one criterion to the other as best suits the purpose of the moment. He does not prove the coincidence of life-sustaining and pleasant activities. He assumes throughout that the pleasant is the opposite of what is painful, and seems unaware of the difficulty of determining by means of terms so highly abstract the specific character of moral action. We find in his theory no satisfactory attempt to discriminate between the pleasure aimed at by the altruist and the immediate pleasure of egoistic action. Similarly he disregards the distinction between pleasant feeling as an immediate motive of conduct and the idea of the attainment of future pleasure whether by the race or by the individual. Spencer confused in effect in the final analysis of the confusions and contradictions of hedonistic psychology.

Nor is his attempt to construct a scientific criterion out of data derived from the biological sciences productive of satisfactory results. He is hampered by a distinction between "absolute," and "relative" ethics definitely formulated in the last two chapters of The Data of Ethics. Absolute ethics would deal with such laws as would regulate the conduct of ideal man in an ideal

IX. 272
society, i.e. a society where conduct has reached the stage of complete adjustment to the needs of social life. Relative ethics, on the other hand, is concerned only with such conduct as is advantageous for that society which has not yet reached the end of complete adaptation to its environment, i.e. which is at present imperfect. It is hardly necessary to say that Spencer does not talk of these two ethical systems in correlation. And the actual criteria and test derived from morality, considered as the highest judgment, are almost ludicrously inadequate. Conduct, e.g., is said to be more moral in proportion as it exhibits a tendency on the part of the individual or society to become more "definite," "coherent," and "heterogeneous." Or, again, we should recognize as a test of the "authoritative" character of moral ideas or feelings the fact that they are complex and representative, referring to a remote rather than to a proximate good, remembering the while that "the sense of duty is transitory, and will diminish as fast as moralization increases." In fact, no acceptable scientific criterion emerges, and the outcome of Spencer's attempt to ascertain the laws of life and the conditions of existence is either a restatement of the dictates of the moral consciousness in vague and cumbersome quasi-scientific phraseology, or the substitution of the meaningless test of "survivability" as a standard of perfection for the usual and inevitable test of "good" and "right."

A similar criticism might fairly be planted upon the majority of philosophers who approach ethics from the standpoint of evolutionary theory. Sir Leslie Stephen, for instance, wishes to substitute the conception of "social health" for that of universal happiness, and considers that the conditions of social health are to be discovered by an examination of the "social organism" or of "social tissue," the laws of which can be studied apart from those laws by which the individuals composing society regulate their conduct. "The social evolution means the evolution of a strong social tissue; the best type is the type implied by the strongest social tissue." But on the important question as to what constitutes the strongest social tissue, or to what extent the analogy between society as at present constituted and organic life is really applicable, we are left without certain guidance. The fact is that with few exceptions evolutionary moral philosophers evade the choice between alternatives which is always presented to them. They begin, for the most part, with a belief that in ethics as in other departments of human knowledge "the more developed must be interpreted by the less developed"—though frequently in the sequel complexity or posteriority of development is erected as a standard by means of which to judge the process of development itself. They are not content to write a history of moral development, applying to it the principles by which Darwinians seek to explain the development of animal life. But the search of origins frequently leads them into theories of the nature of that moral conduct whose origin they are anxious to find quite at variance with current and accepted beliefs concerning its nature. The discovery of the so-called evolution of morality out of "non-moral" conditions is very frequently an unconscious subterfuge by which the evolutionist hides the fact that he is making a prior judgments upon the value of the moral concepts held to be evolved. To accept such theories of the origin of morality would carry with it the conviction that "we look for moral conduct with strong and common origin" and there has been so throughout its history. The illegitimate inference which should follow would be the denial of the validity of those moral laws which have hitherto been regarded as absolute in character, and the substitution for all customary moral terms of an entirely new set based upon biological considerations.

But it is precisely this, the only logical inference, which most evolutionary philosophers are unwilling to draw. They cannot give up the "in cutomary" and "in conformity." Professor Huxley maintained, for example, in a famous lecture that "the ethical progress of society depends not on imitating the cosmic process, still less in running away from it, but in combating it." (Romanes Lecture, ad fin.). And very frequently arguments are adduced by evolutionists to prove that men's belief in the absolute character of moral precepts is one of the necessary means adopted by nature to carry out her designs for the social welfare of mankind. Yet the other alternative, to which such reasoning points, they are reluctant to accept. For the belief that moral obligation is absolute in character, that it is alike impossible to explain its origin and transcend its laws, would make the search for a scientific criterion of conduct to be deduced from the laws of life and conditions of existence meaningless, if not absurd.

Perhaps the one European thinker who has carried evolutionary principles in ethics to their logical conclusion is Friedrich Nietzsche. Almost any system of morality or ethics Nietzsche might find some justification in Nietzsche's writings, which are extraordinarily chaotic and full of the widest extravagators. Yet it has been a true instinct which has led popular opinion as testified to by current literature to find in Nietzsche the most orthodox exponent of Darwinian ideas in their application to ethics. For he saw clearly that the successful evolutionary ethics must involve the "transvaluation of all values," the "demoralization" of all ordinary current morality. He accepted frankly the glorification of brutish strength in superior cunning and all the qualities necessary for successful invincibility struggle for existence, to which the ethics of evolution necessarily tend. He proclaimed himself, before everything else a physiologist, and looked to physiology to provide the ultimate standard of value, though he held that this standard necessarily involves the disappearance of sympathy, love, tolerance and all the existing altruistic emotions, he yet in a sense finds room for them in such altruistic self-sacrifice as prepares the way for the higher man of the future. Thus, after a fashion, he is able to reconcile the conflicting claims of egoism and altruism and succeed where most apostles of evolution fail. The Christian virtues, sympathy, for the weak, the suffering, the poor, represent a necessary stage to be passed through in the evolution of the Ubermensch, i.e. the stage when the weak and suffering combine in revolt against the strong. They are to be superseded, not so much because all social virtues are to be storned and rejected, as because in their effects, i.e. in their tendency to perpetuate and prolong the existence of the weak and those who are least well equipped and endowed by nature, they are anti-social in character and inimical to the survival of the strongest and most vigorous type of humanity. Consequently Nietzsche in effect maintains the following paradoxical position: he upholds the existence of altruism upon egoistical principles; he advocates the total abolition of all altruism by carrying those same egoistical principles to their logical conclusion; he nevertheless appeals to that moral instinct which makes men ready to sacrifice their own narrow personal interests to the higher good of society—an instinct profoundly altruistic in character—as the ultimate justification of the ethics of non-evaluations. Thus the position is a reductio ad absurdum of the attempt to transmute the ultimate character of those intuitions and feelings which prompt men to benevolence. Thus, though incidentally there is much to be learned from Nietzsche, especially from his criticism of the ethics of pessimism, or from the strictures he passes upon the negative morality of extreme asceticism or quietism, his system inevitably provides its own refutation. For no philosophy which traverses the real course of history and distorts the historical facts is likely to confine itself to the sole judgment of mankind: however brilliant be its exposition or ingenious its arguments; finally, the conceptions of strength, power and masterfulness by which Nietzsche attempts to determine his own moral ideal, become, when examined, as relative and unsatisfactory as other criteria of moral action said to be deduced from evolutionary principles. Men desire strength or power not as ends in themselves, but as means to ends beyond them; Nietzsche is most conspicuous when the Ubermensch depics him, becomes intelligible: imagined as Nietzsche describes him he reals back into the past, and that distinction which chiefly separates man from the animal world out of which he has emerged, viz. his unique power of self-consciousness and self-criticism, is obliterated.

It was upon this crucial difficulty, i.e. the transition in the
ETICS

843

evolution of morality from the stage of purely animal and unconscious action to specifically human action,—i.e.,
directed by self-conscious and purposive intelligence
to an end—conceived as good,—that the polemic of
T. H. Green and his idealistic followers fastened. And it is
perhaps unjust to them to say that morality was
chiefly for the purposes of criticism not in themselves vitally
necessary to the theory of morality propounded should have been
regarded as the main contribution to ethical theory of idealist
writers, and as such treated severely by hostile critics. Green's
principal objection to evolutionary moral philosophy is contained
in the argument that no merely natural explanation of the
facts of morality is conceivable. The knowing consciousness,—
i.e., so far as conduct is concerned the moral consciousness,—
can never become an object of knowledge in the sense in which
natural phenomena are objects of scientific knowledge. For such
knowledge implies the existence of a knowing consciousness as
a relating and uniting intelligence capable of distinguishing itself
from the objects to which it relates. And more particularly the existence of the moral consciousness implies "the transition from
mere want to consciousness of wanted object, from impulse to
want, then to effort for the realization of the wanted objects,
implies the presence of the want to a subject which distinguishes itself from it." Consequently the facts of moral
development imply with the emergence of human consciousness
the appearance of something qualitatively different from the
facts with which physiology for instance deals, imply a stratum
as it were in development which no examination of animal
tissues, no calculation of consequences with regard to the pres-
servation of the species can ever satisfactorily explain. However
far back we go in the history of humanity, if the presence of
consciousness be admitted at all, it will be necessary to admit
also the presence to consciousness of an ideal which can be
accepted or rejected, of a power of looking before and after, and
aiming at a future which is not yet fully realized. But un-
fortunately the temporary exigencies of criticism made it
necessary for Green to emphasize the metaphysic of the self,
i.e., to insist upon the necessity of a critical examination of the
pre-requisites of any form of self-consciousness and especially
of the knowing consciousness, to such an extent that critics have
lost sight of the real dependence of his metaphysic upon the
direct evidence of the moral consciousness. The philosophic
value, the sincerity, the breadth and depth of his treatment of
moral facts and institutions have been fully recognized. What
has not been adequately realized is that the metaphysical basis
of his system of ethics—the argument, for example, contained in
the introduction to the Prolegomena—cannot be divorced from his treatment of morals as a whole, and that it
cannot be justly estimated only if interpreted as much as the conclusion of the starting-point of moral theory. The doctrine
of the eternity of the self, for instance, against which much
criticism (e.g., Taylor, The Problem of Conduct, chap. ii.)
has been directed, though it is chiefly expressed in the language of
epistemology, has its roots nevertheless in the direct testimony
of mental experience. For morality implies a power in the
individual, at least above the interests of his own narrower self
and identifying himself in the pursuit of a universal good with
the true interests of all other selves. Similarly the conception of
the self as a moral unity arises naturally out of the impossibility of
finding the summa bonum in a succession of transient states
of consciousness such as hedonism for example postulates. Good
as a true universal can only be realized by a true self, and both
imply a principle of unity not wholly expressible in terms of the
particulars which it unifies. But whether the idealistic inter-
pretation of the nature of universal good be the true one, i.e.,
whether we are justified in identifying that self-consciousness
which is capable of grasping the principle of unity with the
principle of unity which it grasps is a metaphysical and theistic
problem comparatively irrelevant to Green's moral theory.
It would be quite possible to accept his criticisms of naturalism
and hedonism while rejecting many of the metaphysical inferences
which he draws. A somewhat similar answer might be returned
to those critics who find Green's use of the term "self-realization"
or "self-development" as characteristic of the moral ideal unsatis-
factory. It is quite easy to exhibit the futility of such a
conception if understood formally for the practical purposes
of moral philosophy. If the phrase be understood to mean the
attainment of the best possible measure of the self it is
impossible to discriminate sufficiently between the good and bad capacities;
while the realization under present conditions of all the capacities
of a self is impossible. And to aim so far as is possible at all
round development would again ignore the distinction between
vice and virtue. But used in the sense in which Green habitually
uses it self-realization implies, as he puts it, the fulfillment by
the good man of his rational capacity or the idea of a best that is in
existence at present, i.e., the distinction between the good and the bad self is
never ignored, but is the fundamental assumption of his theory.
And if it be urged that the expression is in any case tautological,
i.e., that the good is defined in terms of self-realization and self-
realization in terms of the good, it may be doubted whether any
rational system of ethics can avoid a similar imputation. Green
would admit that in a certain sense the conception of "good"
is indefinable, i.e., that it can only be recognized in the particulars
of conduct of which it is the universal, and this is not confined to
those philosophers who believe in the existence of a criterion of
morality, i.e., a universal test such as that of pleasure, happiness
and the like, by which we can judge of the worth of actions, will
Green's position seem absurd; since, on the contrary, such concep-
tions as those of "self-development" or "self-realization" seem
to have a definite and positive value if they call attention to the
metaphysical implications of morality and accurately characterize
the moral facts. What ambiguity they possess arises from the
ambiguity of morality itself. For moral progress consists in the
actualization of what is already potentially in existence. The
striking merit of Green's moral philosophy is that the idealism
which he advocates is rooted and grounded in moral habits and
institutions: and the metaphysic in which it culminates is
based upon principles already implicitly recognized by the moral
consciousness of the ordinary man. Nothing could be farther
from Green's teaching than the belief that constructive meta-
physics could, unaided by the intuitions of the moral conscious-
ness, discover laws for the regulation of conduct.

But although Green's loyalty to the primary facts of the moral
consciousness prevented him from constructing a rationalistic
system of morals based solely upon the conclusions of metaphysics,
it was perhaps inevitable that the revival of interest in meta-
physic so prominent in his own speculations should lead to a
more daring criticism of ethical first principles in other writers.
Bradley's Ethical Studies and his earlier works have been
undergone an idealistic theory of morality not very far removed from that
of Green's Prolegomena. But the publication of Appearance
and Reality by the same author marked a great advance in
philosophical criticism of ethical postulates, and a growing
dissatisfaction with current reconciliations between moral first
principles, and the conclusions of metaphysics. Appearance
and Reality was not primarily concerned with morals, yet it
inevitably led to certain conclusions affecting conduct, and it
was not very long time before these conclusions were elaborated
in detail. Professor A. E. Taylor's Problem of Conduct
(1901) is one of the most noteworthy and independent
contributions to Moral Philosophy published in recent years.
But it nevertheless follows in the main Bradley's line of
criticism and may therefore be regarded as representative of
his school. There are two principal positions in Professor
Taylor's work: (1) a refusal to base ethics upon metaphysics,
and (2) the discovery of an irreconcilable disharmony in the
nature of morality which takes many shapes, but may be summarized
roughly as consisting in an ultimate opposition between egoism
and altruism. With regard to the first of these Taylor says
(op. cit. p. 4) that his object is to show that "ethics is as indepen-
dent of metaphysical speculation for its principles and methods
as any of the so-called 'natural sciences'; that its real basis
must be sought not in philosophical theories about the nature of
the Absolute or the ultimate constitution of the Universe,
but in the empirical facts of human life as they are revealed to us in our concrete everyday experience of the world and mankind, and sifted and systematized by the sciences of psychology and sociology. Ethics should be regarded as a purely positive or "experimental" and not as a speculative science. With this position the moral opposite to this position will constitute the position of altruism and egoism from the common psychological root of primitive ethical sentiment. Both developments are alike unavoidable, and each is ultimately irreconcilable with the other. Neither egoism nor altruism can be made the sole basis of moral theory without mutilation of the facts, nor can any higher category be discovered by the aid of which their rival claims may be finally adjusted."

Professor Taylor expounds these two theories with great brilliance of argument and much ingenuity, yet neither of them will perhaps carry complete conviction to the minds of the majority of his critics. It is curious, in the first place, to find the independence of moral philosophy upon metaphysics supported by metaphysical arguments. For whatever may be the real character of the interrelation of moral and metaphysical first principles it is obvious that Taylor's own dissatisfaction with current moral principles arises from moral inadherence. Belief in the distinction between morality, i.e., a belief that they are untenable from the standpoint of ultimate metaphysics; and perhaps the most interesting portion of his book is the chapter entitled "Beyond Good and Bad," in which the highest and final form of the ethical consciousness of mankind is subjected to searching criticism. But further, it is becoming increasingly apparent that psychology (upon which Taylor would base morality) itself involves metaphysical assumptions; its position in fact cannot be stated except as a metaphysical position, whether that of subjective idealism or any other. And the need which most philosophers have felt for some philosophical foundation for morality arises, not from any desire to subordinate moral insight to speculative theory, but because the moral facts themselves are inexplicable except in the light of first principles which metaphysics alone can criticize.

Taylor himself attempts to find the roots of ethics in the moral sentiments of mankind, the moral sentiments being primarily feelings or emotions, though they imply and result in judgments of approval and disapproval upon conduct. But it may be doubted whether he succeeds in clearly distinguishing ethical feelings from ethical judgments, and if they are to be treated as synonymous it seems difficult to avoid the conclusion that the implications of moral "judgment" must involve a reference to metaphysics.

Moreover, it is obvious that a great part of Taylor's quarrel with current moral ideals arises from the fact that they do not commend themselves to the moral judgment, i.e. from the standpoint of real goodness they are unsatisfactory, being tainted with evil. Hence it appears difficult to reconcile what is in effect a belief in the validity of the judgments of the moral consciousness with a belief that the real source and justification of that consciousness are to be found in the very sentiments and vague mass of floating feelings upon which it pronounces. Scepticism seems to be the only possible result of such a position. Taylor's polemic against metaphysical systems of ethics is based throughout upon an alleged discrepancy and separation between the facts of moral "experience," the judgments of the moral consciousness, and theories as to the nature of these which the philosophers whom he attacks would by no means accept. There is no doubt a distinction between morality as a form of consciousness and reflection upon that morality. But such a distinction neither corresponds to, nor is commensurate with, the existence of moral "idea" and "idea," and the value of the form and nature of the moral consciousness itself, has given way or is likely to give way to more ambitious and constructive efforts. Taylor's chief endeavour was, as he himself says, to interpret, to vindicate, and to systematize the moral sentiments, and if the actual exhibition of what is involved, e.g., in

concerning the psychological basis of ethics commends itself to the reader. But in his exposition of the fundamental contradiction involved in morality elaborated with much care and illustrative argument he appeals for the most part to facts familiar to the unphilosophical moral consciousness. He begins by defining the various ethical opposites in such a way that the distinctions which secure the production and protection of the coming generation even in the infra-ethical world with which biology deals. He traces this opposition into the forms in which it appears in the social life of mankind (as, e.g., in the difficulty of reconciling the conflicting claims of individual self-development and self-culture and social service), and finds "a hidden root of insincerity and hypocrisy beneath all morality" (p. 243), inasmuch as it is not possible to pursue any one type of ideal without some departure from singleness of purpose. And he finds all the conceptions by which men have hoped to reconcile admitted antagonisms and divergencies between moral ideals claiming to be ultimate and authoritative alike unsatisfactory (p. 285). Progress is illusory; there is no satisfactory goal to which moral development inevitably tends; religion in which some take refuge when distressed by the inexplicable contradictions of moral conduct itself "contains and rests upon an element of make believe" (p. 489).

With Taylor's presentation of the difficulties with which morality is expected to grapple probably few would be found seriously to disagree, though they might consider it unduly pessimistic. But when he turns what is in effect a statement of certain forms of moral difficulty into an attack upon the logical and coherent character of morality itself; he is not so likely to command assent. For the difficulty all men meet with in realizing goodness, or in being moral, is not in itself evidence of an inherent contradiction in the nature of goodness as such. And what perhaps would first strike an unprejudiced critic in Taylor's examples of conflicting ideals or antagonistic yet ultimate moral judgments would be the perception that they are not necessarily moral ideals or judgments at all, and hence necessarily not ultimate.

The claims of self-culture and of social service may when considered in the abstract or in some hypothetical case appear antagonistic and irreconcilable. But when they present themselves to the individual moral consciousness it may be safely asserted (1) that there can be only one moral choice possible, i.e. that their opposition (where they are opposed) involves no conflict of duties; and (2) that whichever ideal is in the end preferred, opportunities will nevertheless be provided within its realization for the concurrent realization of activities and interests ordinarily associated with the other, alleged to be contradictory. For just as there is no self-realization which does not involve self-sacrifice, so there is no room for that species of egoism within the confines of morality which is incompatible with social service.

It will be clear from the foregoing account of Taylor's work that the tendency of his thought, as of that of Bradley, is by no means directed to the confirmation or re-establishment of those principles of conduct recognized by the ordinary moral consciousness. Psychology or metaphysics tend in their systems to usurp the place of authority formerly assigned to ethics proper.

It would be true on the whole to assert that evolutionary systems of ethics such as those of Herbert Spencer, Sir Leslie Stephen or Professor S. Alexander (Moral Order and Martinism, Progress, 1899), together with the metaphysical theories of morals of which T. H. Green and Bradley and Taylor are the chief representatives, have dominated the field of ethical speculation since 1870. Nevertheless it is only necessary to mention such a work as Martinet's Types of Ethical Theory to dispel the notion that the type of moral philosophy most characteristically English, i.e. consisting in the patient analysis of the form and nature of the moral consciousness itself, has given way or is likely to give way to more ambitious and constructive efforts. Martinet's chief endeavour was, as he himself says, to interpret, to vindicate, and to systematize the moral sentiments, and if the actual exhibition of what is involved, e.g., in
moral choice is the vindication of morality Martineau may be said to have been successful. It is with his interpretation and systematization of the moral sentiments that most of Martineau’s critics have found fault. It is impossible, e.g., to accept his ordered hierarchy of “springs of action” without perceiving that the real principle upon which they can be arranged in order at all must depend upon considerations of circumstances and consequences, of stations and duties, with which a strict intuitionism such as that of Martineau would have no dealing.1 Similarly the notion of Conscience as a special faculty giving its pronouncements immediately and without reflection cannot be maintained in the face of modern psychological analysis and is untrue to the nature of moral judgment itself. And Martineau is curiously unsympathetic to the universal and social aspect of morality with which evolutionary and idealist moral philosophers are so largely occupied. Nevertheless there have been few moral philosophers who have, apart from the idiosyncrasies of their special prepossessions, set forth with clearer insight or with greater nobility of language the essential nature of the moral consciousness.

Equal in importance to Martineau’s work is Professor Sidgwick’s Methods of Ethics, which appeared in 1874. The two works are alike in loftiness of outlook and in the fact that they are devoted to the re-examination of the nature of the moral consciousness and to the exclusion of all branch of inquiry. In most other respects they differ. Martineau is much more in sympathy with idealism than Sidgwick, whose work consists in a restatement from a novel and independent standpoint of the Utilitarian position. And Sidgwick has been far more successful than any other moral philosopher with the exception of T. H. Green and Bradley in founding a school of thought. Many of his most acute critics would be the first to admit how much they owe to his teaching. Chief among the most recent of these is G. E. Moore, whose book Principia Ethica is an important original contribution to ethical thought. And although Dr Hastings Rashdall (The Theory of Good and Evil, Oxford, 1907) is not in agreement with Sidgwick’s own particular type of hedonistic theory in his own philosophical position, he occupies a point of view somewhat similar to that of Sidgwick’s main attitude of Rational Utilitarianism. Rashdall’s two volumes exhibit also a welcome return on the part of English thought to the proper business of the moral philosopher—the examination of the nature of moral conduct. Other works, such as Professor L. T. Hobhouse’s Morals in Evolution or Professor E. A. Westermarck’s Origin and Development of the Moral Ideas, testify to a continued interest in the history of morality and in the anthropological inquiries with which moral philosophy is closely connected.

Which is the importance for moral philosophy has recently been written upon problems that more properly belong to the philosophy of religion and the theory of knowledge. J. F. M’Taggart’s Studies in Hegelian Cosmology, and his later work, Some Dogmas of Religion, contain interesting contributions to the theory of pleasure and of the problem of free will and determinism. A notable instance of this tendency is seen in the developments of the theory of pragmatism (q.v.), for which F. C. Schiller has proposed the general term “pragmatical moral socialism.” Such aspects as concerns ethics include, for example, the limited determinism involved in the theory, the attitude of the religious consciousness expressed by William James (Will to Believe and Pragmatism), and the pragmatic conception of the good. And the widespread interest in social problems has produced a revival of speculation concerning questions partly political and partly ethical in character, e.g., the nature of justice. Finally it has become apparent that many problems hitherto considered political concern morality so nearly and so nearly the moral philosopher, and it may be confidently expected that with the increased complexity of social life and the disappearance of many sanctions of morality hitherto regarded as inviolable, the future will bring a renewed and practical interest in the theory of conduct likely to lead to fresh developments in ethical speculation.

moderati Abydainsia), which, from the context would appear to denote a tribe located in S. Arabia," whose name was rendered by the Greek geographers as Annexes and Annexes.

The inhabitants of Ethiopia, partly owing to their honourable mention in the Hellenic poems, attracted the attention of many Greek researchers, from Democritus onwards. Herodotus divides them into two main groups, a straight-haired race and a woolly-haired race, dwelling respectively to the East and West, and this distinction is confirmed by the Ethiopian monuments: from his time onwards various names of tribes are enumerated; and some of these geographically located, most of these appellations being Greek words, applied to the tribes by strangers in virtue of what seemed to be their leading characteristics, e.g. "Long-lived," "Fish-eaters," "Troglydoites," &c. The bulk of our information is derived from Egyptian monuments, whenever it appears that, originally occupied by independent tribes, who were ruled first by Benefer or Snefru, first king of the IVth or last of the IIIrd Dynasty, and generally subjected by Ethiopian kings (the steps in this process are traced by E. W. Budge, The Egyptian Sultan, 1907, i. 399 sqq.). Under the XVIIIth Dynasty it became an Egyptian province, administered by a viceroy (at first the Egyptian king's son), called prince of Kush, and paying tributes in negroes, oxen, gold, ivory, rare beads, hides and household utensils. The inhabitants frequently rebelled and were often subdued; records of these repeated campaigns by the Egyptian kings in the wearing of Egyptian crowns and bearing the titles of pharaohs and pharaoh-Horst (Amenophis III. at Soleb or Sub seems to have been the most magnificent. Ethiopia became independent towards the 11th century B.C., when the XXIst Dynasty was reigning in Egypt. A state was founded, having for its capital Napata (mod. Memnon) at the foot of Jebel Barkel, "the sacred mountain," which in time became formidable, and in the middle of the 8th century conquered Egypt; an Egyptian campaign is recorded in the famous tale of King Pankhi. The fortunes of the Ethiopian (XXVth) Dynasty belong to the history of Egypt (q.v.). After the Ethiopian yoke had been shaken off by Egypt, about 660 B.C., Ethiopia continued independent, under kings of whom not a few are known from inscriptions. Besides a number of whose names have been discovered in cartouches at Jebel Barkel, the following, of whom all but the third have left important styles, can be roughly dated: Tandaman, son of Thahka (667-660), Aspera (660-655), Pankhwar (655-630), Harrath (630-625), Napata (625-570). From the evidence of the stile of the second, the coronation stile and that of the fifth it has been inferred that the sovereignty early in this period became elective, a departure from the various orders in the realm being (as Diodorus states), when a vacancy occurred, sent to Napata, where the chief god Amun selected out of the members of the royal family, the person who was to succeed, and who became officially the god's son; and it seems certain that the priestly caste was more influential in Ethiopia than in Egypt both before and after this period. Another state (called the State of Excommunication) records the expulsion of a priestly family guilty of murder (H. Schäfer, Klio, vii. 487); the name of the sovereign when expelled (there has been obliterated). The state of Harsilu contains the record of nine expeditions, in the course of which the king subdued various tribes south of Merem and built a number of temples. The stile of the last of these sovereigns, now in the Berlin Museum, and edited by H. Schäfer (Leipzig, 1901), contains valuable information concerning the state of the Ethiopian kingdom in its author's time. Shortly after his accession he was threatened with invasion by Cambyses, the Persian conqueror of Egypt, but (according to his own account) destroyed the fleet sent by the invader up the Nile, while (as we learn from Herodotus) the land-force succumbed to famine. (see CAMBYES). It further appears that in his time and in his immediate successor the capital of the kingdom had been removed from Napata, where in the time of Harsilu the temples and palaces were already in ruins, to Mercé at a distance of 60 camel-hours to the south-east. But Napata retained its importance as the religious metropolis; it was thither that the king went to be crowned, and there too the chief god delivered his oracles, which were (it is said) implicitly obeyed. The local names in Nastasen's inscription, describing his royal circuit, are in many cases obscure. A city named Purna (Hierogl. Pa-Nebes) appears to have constituted the most northerly point in the empire. These Ethiopian kings seem to have made no attempt to reconquer Egypt, though they were often engaged in wars with the wild tribes of the Sudan. For the 5th and 4th centuries B.C., the history of the country is a blank. A fresh epoch was; however, inaugurated by Ergamenes, a contemporary of Ptolemy Philadelphus, who is said to have massacred the priests at Napata, and destroyed sacerdotal influence, till then so great that the king might at the priests' order be compelled to destroy himself; Diodorus attributes this measure to Ergamenes' acquaintance with Greek culture, which he introduced into his country. A temple was built by this king at Psiclis (Dakka) to Thoth. Probably the sovereignty again became hereditary. Occasional notices of Ethiopia occur from this time onwards in Greek and Latin authors, though the special treatises by Agatharchides and others are lost. According to these the country came to be ruled by kings named Candace. One of them was involved in war with the Romans in 24 and 23 B.C.; the land was invaded by C. Petronius, who took the fortress Premis or Ibrim, and sacked the capital (then Napata); the emperor Augustus, however, ordered the evacuation of the country without even demanding tribute. The stretch of land the Romans called Susian (Synam and Maharys in Roman) was, however, regarded as belonging to the Roman empire, and Roman cohorts were stationed at the latter place. To judge by the monuments it is possible that there were queens who reigned alone. Pyramids were erected for queens as well as for kings, and the position of the queens was little inferior to that of their consorts, though, so far as monumental representations go, they always yielded precedence to the latter. Candace appears to have been found as the name of a queen for whom a pyramid was built at Moré. A great builder was Netsekama, who is represented with his queen Amantrati on temples of Egyptian style at many points up the Nile—at Amara just above the second cataract, and at Napata, as well as at Moré, Beniga and Naga in the distant Isle of Moré. "He belongs, probably," to the Ptolemaic age. Later, in the Roman period, the type in sculpture changed from the Egyptian. The figures are obese, especially the women, and have pronounced negro features, and the royal person is often shown with bulbous eyes. Of this period also there is a royal pylon, Netsekama and Amantrati, imitating the names of their "conspicuous" predecessors. In the 4th century A.D. the state of Moré was ravaged by the Nabas (?) and the Abyssinians, and in the 6th century its place was taken by the Christian state of Nubia (see DONGOLA).

Contrary to the opinion of the Greeks, the Ethiopians appear to have derived their religion and civilization from the Egyptians. The royal inscriptions are written in the hieroglyphic character and the Egyptian language, which, however, in the opinion of experts, steadily 'deteriorate' after the separation of Ethiopia from Egypt. About the time of Ergamenes or (according to some authorities) before, a "Vehicular name" was employed in inscriptions, written in a special alphabet of 33 signs in parallel hieroglyphic and cursive forms. The "cursive" is to be read from right to left; the hieroglyphic, contrary to the Egyptian method, in the direction in which the figures face. The Egyptian equivalents of six characters have been made out by the aid of bilingual cartouches. Words are divided from each other by pairs of dots, and it is clear that the forms and values of the signs are largely based on Egyptian writing; but as 'yet' decipherment has not been attained, nor can it 'yet' be stated to what group the language should be assigned (F. Ll. Griffith in D. R. Macfver's Aretha, Oxford, 1905, and later researches).

Notes in Greek authors are collected by F. Paulischke, Die geographischen Erhärterien der griechischen Geographen der Hellenistik (Vienna, 1890); the inscriptions were edited and interpreted by G. Musastro, Revue archéol. xxii., xxv., llll. Mém. d'Antiquité et d'Égiplologie, 1832, 1834. R. B. A. M., i. 395, 396, 402. "The Words of the Pharaoh," 1864, vii. 296. See also J. H. Pustedeard, "The Monuments of Sudanese Nubia," in American Journal of Semitic

**ETHIOPIA**

The employment of the Gezz or Ethiopic language for literary purposes appears to have begun no long time before the introduction of Christianity into Abyssinia, and its pagan period is represented by two Axumite inscriptions (published by D. H. Müller in J. T. Bent's *Sacred City of the Ethiopians*, 1893), and an inscription at Matarra (published by C. C. Rossi, *Rendiconti Accad. Livr.* 1890). As a literary language it survived its pagan era, and is still used as a vernacular, but its uses as a sacred and literary language is said to be the latter. In Sir W. C. Conwallis-Harris’s *Highlands of Ethiopia* (1844) there is a list of rather more than 100 works extant in Ethiopic; subsequent research has chiefly brought to light fresh copies of the same works, but it has contributed some fresh titles. A conspectus of all the MSS. known to exist in Europe (over 2,000 in number) was published by E. C. Littmann (in *Zeitschr. für Assyr. u. Archäol.* 1904; *v.* 23, p. 1), of these the largest collection is that in the British Museum, but others of various sizes are to be found in the chief libraries of Europe. E. E. Littmann (in *Zeitschrift für Assyriologie*, vol. 19 and 20) describes two collections at Jerusalem, one of which contains 283 MSS., and Rossi (in *Rendiconti*, 1904) a collection of 35 MSS. belonging to the Catholic mission at Gerren... Other collections exist in Abyssinia, and many MSS. are in private hands. In 1882, besides portions of the Bible some 40 Ethiopic books had been printed in Europe (enumerated in L. Goldschmidt’s *Bibl.-Litteraturzeit.*), but the first Ethiopic...Gezz literature is ordinarily divided into two periods, of which the first dates from the establishment of Christianity in the 5th century, and ends somewhere in the 7th; the second from the re-establishment of the Salomonic dynasty in 1126, continuing to the present time. It consists chiefly of translations, made in the first period from Greek, in the second from Arabic. It has no authors of the first or even of the second order; its style, as a sacred and literary language is due to its translation of the Bible, which in the ordinary enumeration is made to contain 81 books, 46 of the Old Testament, and 35 of the New. These figures are most probably obtained by adding to the ordinary canonical books *Maccabees*, Tobit, Judith, Wisdom, Ecclesiasticus, Baruch, Jubilees, Enoch, the Assumption of Isaiah, Ezra V., Shepherd of Hermas, the Sympos (Canons of the Apostles), the Book of Adam, and Joseph Ben Caron. For the distinction between canonical and apocryphal appears to be unknown to the Ethiopic Church, whose chief service to Biblical literature consists in its preservation of various apocryphal works which other parts of Christendom have lost or possess only in an imperfect form (see *Enoch*, *Jubilees*, *Book of*... It should be observed that the *Maccabees* of the Ethiopic Bible is an entirely different work from the books of that name included in the Septuagint; of which, however, the Abyssinians have a recent version made from the Vulgate; specimens of their own *Maccabees* have been published by J. Horpitz in the *Zeitschrift für Assyriologie*, vol. 17. The MSS. of the Biblical books vary very much, and none of them can claim any great antiquity; the oldest extant. MS. of the fourth century appears to be one in the Museum Borghese, preserved by King Amad Skor (1344) to the Virgin, Mary in Jerusalem (described by N. Kopp, *v*. 1, p. 336). Hence F. de Lagrange supposed the Ethiopic version to have been made from the Arabic, which is in accordance with a native tradition. This opinion is held by few... C. F. A. Dillmann distinguished in the *case* of the Old Testament, three classes of MSS. a *necro antiqua*, made from the Septuagint, (probably in the Chaldean text), a text revised from Greek MSS., and a text revised from the Hebrew (probably through the medium of an Arabic version). An examination of ten chapters of St. Matthew by L. Hackspill (*ibid.* vol. xi.) led to the result that the Ethiopic version of the fourth century was made about 850 AD., and that this original translation is represented by Cod. Paris. Aeth. 32, where most MSS. and all printed editions contain a text influenced by the Alexandrian Vulgate, and show traces of Arabic. Rossi (*ibid.* 232) has made it probable that the...
Abba Salâmá, whom the native tradition identifies with Frumentius, evangelist of Abyssinia, to whom the translation of the Bible was ascribed, was a reality & Metropolitan of the 14th century, who revised the corrupt text then current. Of the ancient translation the latest book is said to be Ecclesiasticus, translated in the year 678. The New Testament has been published repeatedly (first in Rome, 1548-1549; some letters about its publication were edited by I. Guidi in the Archivio della Soc. Rom. di Storia Patria, 1866), and C. F. A. Dillmann edited a critical text of most of the Old Testament and Apocrypha, but did not live to complete it; portions have been edited by J. Bachmann and others.

Other translations thought to belong to the first period are the Sher'atā Makḥār, ascribed to S. Pachomius; the Kerōlos, a collection of homilies and tracts, beginning with Cyril of Alexandria De recta fide; and the Physiologus, a fanciful work on Natural History (edited by F. Hommel, Leipzig, 1877).

Of the works belonging to the second period much the most important are those which deal with Abyssinian history. A court official, called šakāq še'metānlā (secretary), having under him a staff of scribes, was employed to draw up the public annals year by year; and on these official compositions the Abyssinian histories are based. The earliest part of the Axum chronicle preserved is that recording the wars of Amda Sion (1314-1344) against the Moslems; it is doubtful, however, whether even this exists in its original form, as some scholars think; according to the Axum Chronicle in the Addis Ababa manuscript it is preserved in a recession of the time of King Zar'a Ya'qūb. Under King Lebna Dengel (1508-1560) the annals of his four predecessors, Zar'a Ya'qūb, Baeda Maryam, Easender and Na'od (1434-1508) were drawn up; those of the first two were published by J. Perruchon (Paris, 1863); in the Journ. Asiat. for 1894 the same scholar published a further fragment of the history of Baeda Maryam, written by the tutor to the king's children, and the history of Easender, Amda Sion II. and Na'od as compiled in Lebna Dengel's time. The history of Lebna Dengel was published by the same scholar (Journ. Semiit. i. 274) and Rossini (Rendiconti, 1894, v. p. 617); that of his successor Claudius (1540-1559) by Consolam (Paris, 1895); that of his successor Minas (1559-1626) by F. M. E. Pereira (Lisbon, 1888); those of the three following kings, Sharsa Dengel, Zek Dengel, and Ya'qūb, by Rossini (Rendiconti, 1893). The history of the next king, Syeniatus (1626-1691) by Abbe Meherv Dendel and Tekla Sämnas was edited by Pereira (Lisbon, 1892); the annals of Januarius I., Iyasu I. and Bakafta (1682-1750) by I. Guidi, with a French translation (Paris, 1903-1905); all are contemporary, and the names of the chroniclers of the last two kings are recorded. Besides these we have the partly fabulous chronicle of Lalibela (of uncertain date, but before the Solomonian dynasty was restored), edited by Perruchon (Paris, 1892); and a brief chronicle of Abyssinia, drawn up in the reign of Iyasu II. (1790-1753), embodying materials abridged, but often unaltered, was published by R. Basset, in the Journ. Asiat. for 1882 (cf. Rossini in the Rendiconti, 1893-1894, p. 668), and has since formed the basis for Abyssinian history.

Many compilations of the sort exist in MS. in libraries, and great praise is bestowed on the one which E. Rüppel, when travelling in Abyssinia, ordered to be drawn up for his use. It is now in the collection of his MSS. at Frankfurt. Ethnographic scholars speak of a special "historical style" which comes from the mixture of the styles of different periods, and the admixture of Amharic phrases and idioms. The historian of the wars of Amda Sion is credited with some literary merit; most of the chronicles have little.

The remaining literature of the second period is thought to begin somewhat earlier than these chronicles. To the time of King Yekuno Amlāk (1265-1283) the historical romance called Kebra Nagaet (Glory of Kings) is assigned by its editor, C. Bezold (Bavarian Academy, 1904); other scholars gave it a somewhat later date. Its purpose is to glorify the Solomonian dynasty, whence, in spite of a colophon which declares it to be a translation, it was regarded as an original work; since, however, it shows evitent signs of having been translated from Arabic, Bezdol supposes that its author, Ishāq, was an immigrant whose native language was Arabic; in which therefore he naturally wrote the first draft of his work (Kirárends). The book Kebne Nagaet (ob. 1394) belongs the Vision of the Prophet Hubakku in Karta, as also the works of Abba Salâmá, regarded as the founder of the Ethiopian renaissance, one of whose sermons is preserved in a Cheren MS. With his name are connected the Acts of the Passion, the Service for the Dead and the translation of Philotheus, i.e. Philoxenus. King Zar'a Ya'qūb composed or had composed for him as many as seven books; the most important of these is the Book of Light (Mashafa Bēhār), paraphrased and Kirchenordnung, by Dillmann, who gave an analysis of its contents (Über die Regierung des Königs Zar'a Ya'qūb, Berlin, 1884). He also organized the compilation of the Miracles of the Virgin Mary, one of the most popular of Ethiopian books; a magnificent edition was printed by E. W. Budge in the Meux collection (London, 1900). In the same reign the Arabic chronicle of al-Makīn was translated into Geez. Under Lebna Dengel (ob. 1546), besides the above-mentioned collection of chronicles, we hear of the translation from the Arabic of the history and martyrdom of St George, the Commentary of J. Chrysostom on the Epistle to the Hebrews, and the ascetic works of J. Saba called Aragawī manfassāwī. Under Claudius (1540-1559) Maba Sion is said to have translated from the Arabic The Faith of the Pankers, a vast compilation, including the Didascalia Apostolorum (edited by Platt, London, 1834), and the Creed of Jacob Baraduen (published by Cornill, Zünfli, 1893). A study of the ancient Amha of the 16th century, edited by A. Zonoten in Notices et Estudios, vol. xxviii.), The Confession of Faith of King Claudius has been repeatedly printed. The reign of Sharsa Dengel (ob. 1593) was marked by many literary monuments, such as the religious and controversial compilation called Maamara Chrestos, and the translation, by a certain Salix, of the religious encyclopedia (Mashafa Haik) of the monk Nikon; an Arab merchant from Yemen, who took on conversion the name Anbākkom (Habakkuk), translated a number of books from the Arabic. Under Ya'qūb (ob. 1605) the valuable chronicle of John of Nikiou was translated from Arabic (edited by A. Zonoten with French translation in Notices et extraites, vol. xxiv. Under John, about 1687, the Spiritual Medicine of Michael, bishop of Adtrib and Malāq, was translated. The literature that is not accurately dated consists largely of hymns and prayers, and 17th cent. poetry is chiefly, if not entirely, represented by the last of these, the most popular work of the kind being an ode in praise of the Virgin, called Weddase Maryam (edited by K. Fries, Leipzig, 1892). Various hymn-books bear the names Desya, Zemmar and Mawas'et (Antiphones); there is also a biblical history in verse called Mashafa Mekbed or Messira Zomân. Homilies also exist in large numbers, both original and translated, sometimes after the Arab fashion in rhymed prose. Hagiography is naturally an important department in Ethiopian literature. In the great collection called Synasar (translated originally from Arabic, but with large additions) for each day of the year there is the history of one or more saints; an attempt has been made by H. Düning (1900) to derive some actual history from it. Many texts containing lives of individual saints have been issued. Such are those of Maba Sion and Gabra Chrestos, edited by Budge in the Meux collection (London, 1892); the Acts of S. Mercarios, of which a fragment was edited by Rossini (Rome, 1904); the unique MS. of the original, one of the most extensive works in the Gee language, was burned by thieves who set fire to the editor's house. The same scholar began a series of Vitae Sanctorum antiquiorum, while Monumenta Athiopica hagiologiae and Vitae Sanctorum indigenarum have been edited by B. Turaiev (Leipzig and St Petersburg, 1902, and Rome, 1903). Other lives have been edited by Pereira, Guidi, &c. Similar in historical value to these works is the History of the Exploits of Alexander, of which various recensions have been edited by Budge (London, 1892). See further Alexander the Great, section on the legends, ad fin. Of Law the most important monument is the Pasha Nagaet lLITERATURE
ETHNOLOGY AND ETHNOGRAPHY

(Judgment of Kings), of which an official edition was issued by I. Guidi (Rome, 1899), with an Italian translation; it is a version.

Science can scarcely be said to exist in Gez literature, unless a method treatise, of which the British Museum possesses a copy of the 'Assal, of the 12th century, whose work, being meant for Christians living under Moslem rule, was not altogether suitable for an independent Christian kingdom; yet the need for such a code made it popular and authoritative in Abyssinia. The translator was not quite equal to his task, and the Brit. Mus. MS. Soo exhibits an attempt to correct it from the original.

The word "ethnography" is used with a somewhat vague meaning for any ethnological study; each country or that of the whole question of the division of mankind into separate races at all, which is consequential on the earlier problem (dealt with in the article ANTHROPOLOGY) as to man's origin and antiquity.

1. If we assume that man existed on the earth in remote geological time, the question arises, was this pleistocene man specifically one? What evidence is there that he represented in his different habitats a series of varieties of one species rather than a series of species? The evidence is of three kinds, (1) anatomical, (2) physiological, (3) cultural and psychological.

1. Dr Robert Munro, in his address to the Anthropological section of the British Association in 1863, said: "All the osseous remains of man which have hitherto been collected and examined point to the fact that, during the larger portion of the quarternary period, if not, indeed, from its very commencement, he had already acquired his human characteristics."

2. By "cultural plastic" is here meant those anatomical ones which distinguish man from other animals, but which may have been preserved in caves or rock-shelters. Of these the three chief kinds, in order of probable age, are the Trinil (Java) brain-cap, the lowest human skull yet described, characterized by depressed cranial arch, with a cephalic index of 70; the Neanderthal (Germany) skull, remarkable for its flat resting curve with an index of 73-76; and the two nearly perfect skeletons found at Spy (Belgium), the skulls of which exhibit enormous brow ridges and cranial indices of 75. All these skulls stand in conjunction with other well-authenticated human remains such as those found at La Naulette (Belgium); Shipka (Balkan Peninsula), Olmo (Italy), Predmore (Bohemia) and in Argentina and Brazil, make it possible to reconstruct anatomically the varying types of pleistocene man, and to establish the fact that in essential features the same primitive type has persisted through all time. The skeleton bones show differences so slight as to admit of pathological or other explanation. What Professor Kollmann says of man-to-day was true in the remotest ages. Referring to Cuvier's statement that from a single bone it is possible to determine the very species to which an animal belongs, he says, "Precisely on this ground I have mainly concluded that the existence of several human species cannot be recognized, for we are unacquainted with a single tribe from a single bone of which we might with certainty determine to what species it belonged." Such differences as the bones exhibit are progressive modifications towards the higher neolithic and modern types, and are in themselves entirely incapable of supporting the theory that the owner of the Trinil skull, say, and the "man of Spy" belonged to separate species. All these "osseous remains" belong to the palaeolithic period, and from the cranial indices it is thus clear that palaeolithic man was long-headed. Neolithic man is, speaking generally, round-headed; and it's been urged that round-headedness is entirely synchronous with the neolithic age. That the long-headed and the palaeolithic remains of man kind gave place all at once to the round-headed neolithic species. The point thus raised involves the physiological as well as, indeed more than, the anatomical proofs of man's specific unity,
All physiologists agree that species cannot breed with species. Darwin himself laid it down as a fundamental principle. In the same way, all animal possessions and nation possessions, species, they would be found to remain distinct throughout all time. This is not the case. There is evidence that extreme dolichocephaly continued into neolithic times, and was only slowly modified into brachycephaly. In the neolithic caves of Italy, Austria, Belgium, and the barrows of Great Britain, skulls of all types are found. The later cave-dwellers and early dolmen builders of Europe were all long-headed, thus of medium age, and finally in some places, exclusively round-headed. In England, the round-heads appear to be synchronous with the metal age, as shown by the contents of the barrows, and, as on the continental mainland, the two types gradually blended. Permanent fertility between them in prehistoric Europe is thus proved. And this is the case throughout the habitable globe.

An examination of the present repasts of American man suggests the view that the human species has not varied since quaternary times. The palaeolith, type is, to be found among modern European populations. Certain skulls from South Australia resp. cast in almost the same mould, as the Neanderthal. After thousands of years nearly pure descendants of quaternary man are found among living races. And man's mutual fertility in prehistory is repeated throughout historic times; strict racial purity is almost unknown. Thus the theory of the species man is proved by the test of fertility. (From Sir H. J. A. Keatinge.)

The implements in distant lands, writes Sir J. Evans, are so identical in form and character with the British specimens that they might have been manufactured by the same hands. On the banks of the Nile, many hundreds of feet above its present level, implements of the European type have been discovered; while in Somaliland, in an ancient river valley at a great height above the sea, Sir H. H. Johnston has collected a large number of implements formed of flint and quartzite, which, judging from their form and character, might have been dug out of the drift-deposits of the Sume and the Seine, the Thames or the ancient Solent.

This identity in the earliest arts, is repeated in the later stages of man's culture; his arts and crafts, his manners and customs, exhibit a similarity so close as to compel the presumption that all the races are but divisions of one family. But perhaps the greatest psychical proof of this unity is his common possession of language. Theodore Wauchope writes: "Inasmuch as the possession of a language of regular grammatical structure forms a fixed barrier between man and brute, it establishes at the same time a near relationship between all people in psychical respects." In the presence of this common feature of the human mind, all other differences lose their import. (From Anthropology, p. 273.) As Dr. J. C. Frazer urged, the "same inward mental structure is to be recognized in all races of men. When we compare this fact with the observations, fully established, as to the specific instincts and separateness of human endowments of all the distinct tribes of sentient beings in the universe as we are enabled to draw confidently, the conclusion that all human races are of one species, and one family." It has been argued that stock languages imply stock races, but this assumption is untenable. There are some fifty irreproducible stock languages in the United States, and Canada, yet, taking into consideration the physical and moral homogeneity of the American Indian races, he would be a reckless theorist, who held that there were therefore fifty separate human species. If it were so, how have they descended? There are no anthropoid apes in America, none of the species higher than the baboons, from which it is impossible to trace men. Again, in Australia there is certainly one stock language, yet there are not even two.

In Caucasus, there are many distinct forms of speech, yet all the peoples belong to the Caucasian division of mankind.

Man, then, may be regarded as specifically one, and thus he must have had an original cradle-land, whence the peopling of the earth was brought about by migration. The evidence tends to prove that the world was peopled by a generalized proto-human form. Each division of mankind would thus have had its pleistocene ancestors, and would have become differentiated from each other in the course of time.

As to the man's cradle-land there have been many theories, but the weight of evidence is in favour of Indo-Malaysia.

Of all animals man's range alone coincides with that of the habitable globe, and the real difficulty of the "cradle-land" theory lay in explaining how the human race spread to every land. This problem has been met by geology, which proves that the earth's surface has undergone great changes since man's appearance, and that the distributary streams of the oceans once existed, making a complete land communication from Indo-Malaysia. The evidence for the Indo-African continent has been summed up by R. P. Oldham, and proves no less cogent, are available of the former existence of an Eur-African continent, while the extension of Australia in the direction of New Guinea is more than probable. Thus, the ascendant of man was free to move in all directions over the eastern hemisphered.

The western hemisphere was more than probably connected with Europe and Asia in Tertiary times, by a continent, the existence of which is evidenced by a submarine bank stretching from Scotland through the Faroes and Iceland to Greenland, and on the other side by continuous land at what is now the Bering Straits.

Acclimatisation has been urged as an argument against the "cradle-land" theory, but the peopling of the globe took place in interglacial if not pre-glacial ages, when the climate was much milder everywhere, and the climatic conditions met climatic difficulties in his migrations.

Probably before the close of Palaeolithic times all the primary divisions of man were specialized in their several habitats by the influence of their surroundings. The profound effect of climate is seen in the relative culture of races. Thus, tropical countries are inhabited by savage or semi-savage peoples, while the higher mental development is more common where the temperature is lower. The primary divisions of mankind, Ethnological, are racially differentiated in neolithic times, and these criteria had almost certainly occurred not consecutively in one area but simultaneously in several areas. A Negro was not metamorphosed into a Mongol, nor the latter into a White, but the several semi-simian precursors under varying environments developed into generalized Negro, generalized Mongol, generalized Caucasian.

Taking, then, these three primary divisions as those into
ETHYL—ETHYLENE

which it is most resemble broadly to divide mankind, they may be analysed as to their racial constituents and their habits as follows:

1. Caucasian or White Man is best divided, following Huxley's ari (a) Kaarthochor or "fair whites" and (b) Malacochor or "dark whites". (a) The first—tall, with almost colourless skin, blue or grey eyes, hair from straw colour to chestnut, and skulls varying as to proportions at will—are the prevalent inhabitants of Northern Europe, and the type may be traced into North Africa and eastward as far as India. On the south and west it fuses with that of the Malacochor (b) on the north and east with that of the Mongoloids. (b) The "dark" whites are of shorter habit, with black skin, dark hair, and blue eyes. The type is well marked from the fair wheats of the Caucasian, and is to be found in the easternmost of the Caucasian, to white hair and of the dusky hair to black, while the stature is somewhat shorter and the frame lighter. To this division belong a large part of these clasped as Celts, and of the populations of Southern Europe, such as Spaniards, Greeks, and Arabs, extending as far as India, while endless intermediate grades between the two white types occur to ages of intermixture.

Besides these two main types, the Caucasian division of mankind has been held with much reason to include aberrant types, as the brown Polynesian races of the Eastern Pacific, Samoans, Hawaiians, Maoris, etc., the proto-Malays of the Eastern archipelago, some termed Indonesians, represented by the Dyaks of Borneo and the Battaks of Sumatra, the Todas of India and the Ainu of Japan.

3. Mongoloid or Yellow Man prevails over the vast area lying east of a line drawn from Lapland to Siam. His physical characteristics are short, squat body, yellow-brown or coppery complexion, hair, straight and black, flat small nose, broad skull, usually without prominent brow-ridges, and black oblique eyes. Of the typical Mongoloid races the chief are the Chinese, Tibetans, Burmese, Siamese, the Finnish group of races occupying Northern Europe, such as Finns, Lapps, Samoyedes and Gilyaks, and the Arctic Asiatic group represented by the Chukchi and Kamchadales; the Turcs, Gilyaks and Gils of north of, and the Mongols proper west of, Manchuria; the people of the Japanese and Koreans. Less typical, but with the Mongoloid elements so predominant as to warrant inclusion, are the Malay peoples of the Eastern archipelago. Lastly, though differentiated in many ways from the true Mongol, the American races from the Amazon to the Pampas must be reckoned in the yellow division of mankind.

Negro or Black Man is primarily represented by the Negro of Africa between the Sahara and the Cape, distantly in East Africa, and partly in Madagascar, where the Chagos Islands are located. The "black" has a dark-brown skin, often brown-black, with eyes of the same color, and hair usually black and always long and wavy. The skull is narrow, with prominent ridges not prominent, the jaws are short, the nose is flat and broad, and the lips are thick and inverted. Two important families are classified in this division: some authorities hold, as special modifications of the typical Negro (to-day) ethnic as are: (a) the earliest known Negroid type of mediocrity, known as the Bushmen, of South Africa, distinguished in stature and of a yellow-brown or brownish-black color, with the neighboring Hottentots believed to be the result of crossing between the Bushmen and the true Negro: (b) the large Negrito family, represented in Africa by the tall races of the equatorial forests, the Akan, Bats, Woyas, and others, and beyond Africa by the Andaman Islanders, the Asattas of the Philippines, and probably the Senoas and other aboriginal tribes of the Malay Peninsula. The Negroid type seems to have been the earliest predominant in the South Sea islands, but it is impossible to say certainly whether it is itself derived from the Negrito, or the latter is a modification of it, as has been suggested above.

In Melanesia, the Papuans of New Guinea, of New Caledonia, and other islands; represent a more or less Negroid type, as did the new extinct Tasmanians.

Excluded from this survey of the grouping of Man are the aborigines of Australia, whose ethical affiliation is much disputed. Probably they are to be reckoned as Dravidian, a very different stock of Caucasian and Negro man. For a detailed discussion of the branches of these three main divisions of Man, the reader must refer to articles under race headings, and to Negroid, Negritos, Mongols, Malays, Indians, North Americans, Australians, Africa, etc.

ETHYL, in chemistry, the name given to the alky radical 

CH₃. The compounds containing this radical are treated under other headings; the hydride is better known as ethane, the alcohol, CH₃OH, is the ordinary alcohol of commerce, and the oxide (CH₃O)₂ is ordinary ether.

ETHYL CHLORIDE, or Hydrochloric Ether, C₂H₅Cl, a chemical compound prepared by passing dry hydrochloric acid gas into absolute alcohol. It is a colourless liquid with a sweetish bitter taste and an agreeable odour. It is not volatile like ether. Boiling at 112.5° C (236° F), and is therefore a gas at ordinary room temperatures; it is stored in glass tubes fitted with screwed capseez. The vapour burns with a smoky green-edged flame. It is largely used in dentistry and slight surgical operations to produce local anaesthesia (p.,) and is known by the trade-name celene. More volatile anaesthetics such as amyl or amyl and ether, and toluol are produced by mixing with methyl alcohol and methyl chlorides with ethyl bromide is known as somnother.

ETHYLCHEM, or ETHENE, C₂H₄, or H₂C=CH₂, the first representative of the series of olefin hydrocarbons, is found in coal gas. It is usually prepared by heating a mixture of ethyl alcohol and sulphuric acid. G. S. Newb (Jour. Chem. Soc., 1901, 79, p. 63) obtained a pure product by dropping ethyl alcohol into acryl phosphoric acid (sp. gr. 1.75), warmed at 100° C, subsequently raising the temperature, to 200° C., It can also be obtained by the action of sodium on ethylene chloride (B. Tillet, Ann., 1866, 157, p. 314), by the reduction of copper acetylide with zinc dust, and ammonia, by heating ethyl bromide with an alcoholic solution of caustic potash and boiling off the mixture of carbon bisulphide and sulphonated hydrocarbons over red-hot copper, and by the electrolysis of a concentrated solution of potassium permanganate, 

It is a colourless gas of somewhat sweetish taste; it is slightly soluble in water, but more so is alcohol and ether. It is readily available at 15-25° C under a pressure of 4.5 atmospheres. It boils at 148° C and melts at 126° C (K. Olbrink, K. Olbrink). It is critical temperature is 13° C, its specific gravity is 0.884 (air = 1). The specific gravity of liquid ethylene is 0.936 (35°C). Ethylene burns with a bright luminous flame, and forms a very explosive mixture with oxygen. For the combustion of ethylene see FLAME. On strong heating it decomposes, giving, among other products, carbon, methane and acetylene (M. Berthelot, An., 1865, 399 p. 250): Being an unsaturated hydrocarbon, it is capable of forming addition products, e.g., it combines with hydrogen in the presence of platinum black, to form ethane, 

C₂H₄, with sulphur trioxide to form carbonyl sulphate, C₄H₆SO₃, and with hydrobromic and hydrochloric acids at 100° C. to form ethyl bromide, C₂H₅Br, and ethyl fluoride, C₂H₅F, with sulphuric acid at 160-170° C, to form ethyl sulphuric acid, C₂H₅HSO₄, and with hypochlorous acid to form glycol chlorhydrin, C₂H₅-O-HCl. Ethylene is the starting point for the production of glycol HO-CH₂-CH₂-OH, whilst fuming nitric acid converts it into acetic acid. Several compounds of ethylene and metallic
ETIENNE—ETNA!

ÉTIENNE, CHARLES GUILLAUME (1778-1845), French dramatist and miscellaneous writer, was born near Saint Dizier, Haute Marne, on the 6th of January 1778. He held various municipal offices under the Revolution and came in 1796 to Paris, where he produced his first opera, Le Rêve, in 1799, in collaboration with Antoine Frédéric Gresnich. Although Étiene continued to write for the Paris theatres for twenty years after that date, he is remembered chiefly as the author of one comedy, which excited considerable controversy. Les Deux Genêres was represented at the Théâtre Français on the 11th of August 1810, and procured for its author a seat in the Academy. A rumour was put in circulation that Étiene had drawn largely on a manuscript play in the imperial library, entitled Conaxa, ou les génires duprés. His rivals were not slow to take up the charge of plagiarism, to which Étiene replied that the story was an old one (it existed in an old French fabliau). He was, however, driven later to make admissions which at least showed a certain lack of candour. The bitterness of the attacks made on him was no doubt in part due to his position as editor-in-chief of the official Journal de L'Empire. His next play, L'Intrigante (1812), hardly maintained the high level of Les Deux Genêres; the patriotic opera L'Orphéonisme and his lyric masterpiece Jocasté date from 1814. Étiene had been secretary to Hugues Bernard Maret, duc de Tallrand, and in his capacity had accompanied Napoleon throughout his campaigns in Italy, Germany, Austria and Poland. During these journeys he produced one of his best pieces, Brueys et Palaprat (1807). During the Restoration Étiene was an active member of the opposition. He was seven times returned as deputy for the department of Meuse, and was in full sympathy with the revolution of 1830, but the reforms actually carried out did not fulfil his expectations, and he gradually retired from public life. Among his other plays may be noted: Les Deux Mères, Le Pacha de Sousems, and La Petite École des fées, all produced in 1802, in collaboration with his friend Gaugain de Nanteuil (1778-1830). With Alphonse Dieudonné Martinville (1779-1830) he wrote an Histoire du Théâtre Français (4 vols., 1803) during the revolutionary period. Étiene was a bitter opponent of the romanticists, one of whom, Alfred de Vigny, was his successor and panegyrist in the Academy. He died on the 13th of March 1845.

His Œuvres (6 vols., 1846-1853) contain a notice of the author by L. Thiers.

ETIQUETTE, a term for ceremonial usage, the rules of behaviour observed in society, more particularly the formal rules of ceremony to be observed at court functions, &c., the procedure, especially with regard to precedence and promotions in an organized body or society. Professions, such as the law or medicine, observe a code of etiquette, which the members must observe as protecting the dignity of the profession and preventing injury to its members. The word is French. The O. Fr. etiquette or estiquet meant a label, or "ticket," the true English derivative. The ultimate origin is Teutonic, from sticken, to post up, stick, affix. Conrave explains the word in French as a billet for the benefit or advantage of him that receives it, a form of introduction and also a notice affixed at the gate of a court of law. The development of meaning in French from a label to ceremonial rules is not difficult in itself, but, as the New English Dictionary points out, the history has not been clearly established.

ETNA (Gr. Aeryn, from olbe, burn; Lat. Aeina), a volcano on the east coast of Sicily, the summit of which is 15,250 ft. by W. of Catania. Its height was ascertainment to be 10,738 ft. in 1900, having decreased from 10,870 ft. in 1861. It covers about 460 sq. m., and by rail the distance round the base of the mountain is 80 m., though, as the railway line in some places travels much, the correct measurement is about 91 m. The height cannot have been very different in ancient times, for the so-called Torre del Filosofo, which is only 1188 ft. below the present summit, is a building of Roman date. The shape of it that of a truncated cone, interrupted on the west by the Valle del Bove, a huge scarp 14 m. wide, bounded on three sides by perpendicular cliffs (2000 to 4000 ft.). Its south-west portion, which is the deepest, was perhaps the original crater. There are also some 200 subsidiary cones, some of them over 3000 ft. high, which have risen over lateral fissures. On the slopes of the mountain there are three distinct zones of vegetation, distinguished by Strabo (vi. p. 273 fl.). The lowest, up to about 3000 ft., is the zone of cultivation, where vegetables, and above them where vines and olives flourish. Owing to its extraordinary fertility it is densely populated, having 500 inhabitants per sq. m. below 3000 ft., and 900 inhabitants per sq. m. in the triangle between Catania, Nicolosi and Acireale. The next zone is the wooded zone, and is hardly inhabited, only a few isolated houses occurring. The lower part of it (up to about 6000 ft.) consists chiefly of forests of evergreen pines (Pinus nigraiana), the upper (up to about 8800 ft.) of birchwoods (Betula alba). A few oaks and red beeches occur, while chestnut trees grow anywhere between 1000 and 3500 ft. In the third and highest zone the vegetation is stunted, and there is a narrow zone of sub-Alpine shrubs, but no Alpine flora. In the last 2000 ft. five phaeogamous species only are to be found, the first three of which are peculiar to the mountain: Senecio Etnensis (which is found quite close to the crater), Anthēmis Etnensis, Robertia laricaceoides, Tanacetum vulgare and Aetropus xanthus. No trace of animal life is to be found in this zone; for the greater part of the year it is covered by snow, but by the end of summer has almost all melted, except for that preserved in the covered pits in which it is stored for use for cooling liquids, &c., in Catania and elsewhere. The ascent is best undertaken in summer or autumn. From the village of Nicolosi, 9 m. to the N.W. of Catania, about 7 or 8 hours are required to reach the summit. Thucydidus mentions eruptions in the 8th and 9th centuries a.c., and others are mentioned by Livy in 1125, 1126, and 435 b.c. Catania was overwhelmed in 1169, and many other serious eruptions are recorded, notably in 1666, 1820, 2854, 1865, 1789, 1886, 1892, 1899, and March 1910.

According to Lyell, Etna is rather older than Vesuvius:—perhaps of the same geological age as the Norwich Crags. At Trezza, on the eastern base of the mountain, basaltic rocks occur associated with fissiliferous Pliocene clays. The earliest eruptions of Etna are older than the Glacial period, in Central and Northern Europe. In the 15th century Etna became an active volcano, and for many centuries certain portions of the mountain were covered with snow; when these were stripped from the mountain, the dimiation of bulk would be extremely slight. Lyell concluded that, although no approximation can be given of the age of Etna, its "foundations were laid in the sea in the newer Pliocene period." From the slope of the strata from one central point in the Val del Bue he further concluded that there once existed a second great crater of permanent eruption. The rocks erupted by Etna have always been very constant in composition, viz, varieties of basaltic lava and tuff containing little or no olivine—the rock type known as labradorite. At Acireale the lava has assumed the prismatic or columnar form in a striking manner; at the rock of Acì it is in parts spheroidal. The Grotte des Chèvres has been regarded as an enormous gas-bubble in the lava. The remarkable stability of the mountain appears to be due to the innumerable dikes which penetrate the lava flows and tuff beds in all directions and thus bind the whole mass together.

From the earliest times the mountain has naturally been the subject of legends. The Greeks believed it to be either the mountain with which Zeus had crushed the giant Typhon (so Pindar, Pyth. i. 34 seq.; Achillids, Prometheus Vinctus, 531 seq.; Strabo xiii. p. 626), or Enceladus (Virgil, Geor. i. 471; Oppian, Cyn. i. 273), or the workshop of Hephaestus and the Cyclopes (Cic. De dom. ii. 10; cf. Lucil, Acéna, 41 seq., Solin, 17). Several Roman writers, on the other hand, attempted to explain the phenomena which it presented by such natural causes (e.g. Lucilius vi. 630 seq.; Lucullus, Acéna, 531 seq.). Ascents
of the mountain were not infrequent: in those days—one was made by Hadrian.

See Sartorius von Waltershausen, Atlas des Alten (Leipzig, 1866); E. Chini, Carte Vulcanologica e topografica dell’Etna (showing lava streams), 1907, of London. The dedication to the duke of York

ETNA, a borough of Allegheny county, Pennsylvania, U.S.A., in the western part of the state, on the W. bank of the Allegheny river (about 5 m. from its junction with the Monongahela), and about 3 m. N. of the city of Pittsburgh, of which it is a suburb. Pop. (1860) 2334; (1870) 3767; (1900) 5384; of whom 1702 were foreign-born. It is served by the Pennsylvania railway and by electric lines. Among its industrial establishments are rolling mills, tube and pipe works, furnaces, steel mills, a brass foundry, and manufactories of electrical railway supplies, boxes, asbestos coverings, enamel work and tile. The city's industrial history dates from 1830, when a small factory for the manufacture of scythes and sickles was set up. Natural gas, piped from Butler county, was early used here as a fuel in the iron mills. Etna, formerly called Stewart's Town, was incorporated as a borough in 1869.

Eton, a town of Buckinghamshire, England, on the north (left) bank of the river Thames, opposite Windsor, within which parliamentary borough it is situated. Pop. of urban district (1901) 3301. It is famous for its college, the largest of the ancient English public schools. The "King's College of Our Lady of Eton beside Windsor" was founded by Henry VI. in 1440-1441, and endowed mainly from the revenues of the alien priories suppressed by Henry V. The founder followed the model established by William of Wykeham in his foundations of Winchester and New College, Oxford. The original foundation at Eton consisted of a provost, 10 priests, 4 clerks, 6 choristers, a school-master, 25 poor and indigent scholars, and the same number of poor men or bedseamen. In 1443, however, Henry considerably altered his original plans; the number of scholars was increased to 70, and the number of bedseamen reduced to 13. A connection was then established, and has been maintained ever since, though in modified form, between Eton and Henry's foundation of King's College, Cambridge. One of the king's chief advisers was William of Wykeham, who had been master of Winchester College, and was appointed provost of Eton in 1443. Among further alterations to the foundation in this year was the establishment of commensales or commoners, distinct from the scholars, and these under the name of "opippana" now form the principal body of the boys. The college survived with difficulty the unsettled period at the close of Henry's reign; while Edward IV. cancelled its provisions, and was at first desirous of making it a monastic establishment with the ecclesiastical foundation of St. George, Windsor Castle. In 1506 the annual revenue amounted to £652; and through benefactions and the rise in the value of property the college has grown to be very richly endowed. In 1570 commissioners under an act of 1568 appointed the governing body of the college to consist of the provost of Eton, the provost of King's College, Cambridge, five representatives nominated respectively by the college and provost, the chancellor of Cambridge, the Royal Society, the lord chief justice and the masters, and four representatives chosen by the rest of the governing body. By this body the foundation was in 1872 made to consist of a provost and ten fellows (not priests, but merely the members of the governing body other than the provost), a headmaster of the school, and a lower master, at least seventy scholars (known as "collegens"), and not more than two chaplains or conductors. Originally it was necessary that the scholars should be born in England, of lawfully married parents, and be between eight and sixteen years of age; but according to the statutes of 1827 the scholarships are open to all boys who are British subjects, and (with certain limitations as to the exact date of birth) between twelve and fifteen years of age. A number of foundation scholarships for King's College, Cambridge, are open for competition amongst the boys; and there are besides several other valuable scholarships and exhibitions, most of which are tenable only at Cambridge, some at Oxford, and some at either university. The teaching embraces the customary range of classical and modern subjects; but until the first half of the 19th century the normal course of instruction remained almost wholly classical; and although there were masters for other subjects, they were disconnected with the general business of the school, and were awarded at small extra mark. The buildings consist of two quadrangles, built partly of freestone but chiefly of brick. The outer quadrangle, or school-yard, is enclosed by the chapel, upper and lower schools, the original scholars' dormitory ("long chamber"), now transformed, and masters' chambers. It has in its centre a fountain and statue of the royal founder. The buildings enclosing the inner or lesser quadrangle contain the residence of the fellows, the library, hall and various offices. The chapel, on the south side of the school-yard, represents only the choir of the church which the founder originally intended to build; but as this was not completed Waynflete added an ante-chapel. The chapel was built upon a raised platform of stone, as was the hall, in order to lift it above the flood-level of the Thames. It contains some interesting monuments of provosts of the college and others, and at the west end of the ante-chapel is a fine marble statue of the founder in his royal robes, by John Bacon. A chantry contains the tomb of Roger Lupton (provost 1503-1535), whose most notable monument is the fine tower between the school-yard and the cloisters to the east; though other parts of his building also remain. The space enclosed by two buttresses on the north side of the chapel, at the point where steps ascend to the north gateway, is the model of the peculiar form of court in the game of five which takes name from Eton, with its "buttery" (represented by the projecting balustrade), the ledges round the walls, and the step dividing the floor into two levels. From the foundation of the college the chapel was used as the parish church until 1834, and not until 1895, after the alteration of the ancient constitution and elaboration of the foundation, was the parish of Eton created into a separate vicarage. The chapel does not accommodate the whole school; and a new chapel, from the designs of Sir Arthur Blomfield, is used by the lower school. The library contains many manuscripts (notably an Oriental and Egyptian collection) and rare books; and there is also a library for the use of the boys. The college in modern times has far outgrown its ancient buildings, and new buildings, besides the lower chapel, include the new schools, with an observatory, a chemical laboratory, science schools and boarding-houses. In 1905 King Edward VII. opened a fine range of buildings erected in honour of the Old Etonians who served in the South African War, and in memory of those who fell there. The architect was Mr. L. K. Ball, an Old Etonian. The buildings include a school hall, a—school Octagonal Library and a classical museum.

The annual congregation is held on the 11th, the birthday of King George III, who had a great kindness for the school. This is the season of the year; and after the ceremonies in the school a procession of boats takes place on the Thames. In the sport of rowing Eton occupies a unique position among the public schools, and a large proportion of the oarsmen in the annual Oxford and Cambridge boat-race are alumni of the school. Another annual congregation is the occasion of the contest between the schools at Eton and Harrow, at Stow's Ground, on the Thames, on the 1st November. The game of football commences and the match usually takes place at Eton. There is also a peculiar rule for the game of football known as the wall game, from the fact that it is played against a wall bordering the college playing-ground. In 1893, under the name of St. Andrew's Day, the 30th November, the celebrated game of football commonly played at Eton has also peculiar rules. The annual cricket match between Eton and Harrow schools, at Lord's ground, London, is always attended by a large and fashionable gathering. A singular custom termed the Montem, of unknown origin, but first mentioned in 1563, was observed here triennially on Whit-Tuesday. The last celebration took place in 1844, the ceremony being abolished just before it fell due in 1847. It consisted of a procession of the boys in a kind of military order, with flags and music, headed by their captain, to a small mound called Salt Hill, near the Bath road, where they levied contributions.
or "salt," from the passers-by and vendors. The sum collected sometimes exceeded £1,000—the surplus, after deducting certain expenses, becoming the property of the captain of the school. The average number of pupils at Étretat exceeded 1,000.

See E. Cressey, Memoirs of Eminence Etruscan, with Notices of the Early History of the College (1850); Sketches of Etruscan (1873); Sir H. C. Maxwell Lyte, History of Etruscan College from 1440 to 1873 (1875); H. J. Hening, Memoirs of Celebrated Romans (1875); The Etruscan Gallery, by a Barrister of the Inner Temple (1875); A. C. Benson, Fasti Etruscani (1880); H. C. Cure, History of Etruscan College (1875).

ÉTRETAT, a watering-place of France; in the department of Seine-Inferieure, on the coast of the English Channel, 164 m. N. by E. of Havre by road. Pop. (1906) 1,882. It is situated between fine cliffs which, here and there, the sea has worn away, pinnacles and other curious forms. The small stream traversing the valley, at the extremity of which Étretat lies, flows underground for some distance but rises to the surface on the beach. A Roman road and aqueduct and other Roman and Gallic remains have been discovered. The church of Notre-Dame, a Romanesque building, with a nave of the 11th century, and a central tower and choir of the 13th century, is a fine example of the Norman architecture of those periods. Fishing is carried on, though there is no port and the fishermen haul their boats up the beach; the old bulks (sagolos) serve as sheds and even as dwellings. Étretat sprang into popularity during the latter half of the 19th century, largely owing to the frequent references to it in the novels of Alphonse Karr.

ÉTRURIA, the ancient district of Italy, the extent of which varied considerably, and, especially in the earliest periods, is very difficult to define (see section Language). The name is the Latin equivalent of the Greek Tyrrhenia or Tyrrhenia, the Romans also spoke of Tusci, whence the modern Toscury (q.v.). In early times the district appears to have included the whole of N. Italy from the Tiber to the Alps, but by the end of the 7th century n.c., it was considerably diminished, and about the year 600 n.c., its boundaries were the Arno (Arno), the Arpennides and the Tiber. In the division of Italy by Augustus it formed the region and extended as far north as the river Maen, which separated it from Liguria.

HISTORY. The authentic history of Etruria is very meagre, and consists mainly in the story of its relations with Carthage, Greece and Rome. At some period unknown, prior to the 6th century, the Etruscans became a conquering people, and invaded their territory, not only on the north, where, probably, Marcus Fensina, Melpum and perhaps Hadria and Raveola (Etruria Circumpavana), but also southwards into Latium and Campania. The chronology of this expansion is entirely unknown, nor can we recover with certainty the names of the districts which constituted the two leagues of twelve founded in the conquered districts on the analogy of the original league in Etruria proper (below). In the early history of Rome the Etruscans play a prominent part. According to the semi-historical traditions they were the third of the constituent elements which went to form the city of Rome. The tradition has been the subject of much controversy, and is still an unsolved problem. It is practically certain, however, that there is no foundation for the ancient theory (cf. Prop. 4. v. 1. 31) that the third Roman tribe, known as Luceres, represented an Etruscan element of the population, and it is held by many authorities that the tradition of the Tarquin kings of Rome represents, not an immigrant wave, but the migration of the dominion of Etruscan lords, who extended their conquests some time before 600 n.c. over Latium and Campania. This theory is corroborated by the fact that during the reigns of the Tarquin kings Rome appears as the mistress of a district including part of Etruria, several cities in Latium, and the whole of Campania, whereas our earliest picture of republican Rome is that of a small state in the midst of enemies. For this problem see further under Rome: History, section 8.1. The Mahabharata.

After the expulsion of the Tarquins the chief events in Etruscan history are the vain attempt to re-establish themselves in Rome under Lars Porsena of Clusium, the defeat of Octavius Mamilius, son-in-law of Tarquinius Superbus, at lake Regillus, and the treaty with Carthage. This last event shows that the Etruscan power was formidable, and that by means of their fleet the Etruscans held under their exclusive control the commerce of the Tyrrhenian Sea. By this treaty Carthage was assigned to the Etruscans while Carthage obtained Sardinia. Soon after this, decay set in. In 474 the Etruscan fleet was destroyed by Hiero I. (q.v.) of Syracuse; Etruria Circumpavana was occupied by the Gauls, the Campanian cities by the Samnites, who took Capua (see CAMPAHIA) in 423, and in 356, after a ten years' siege, Veii fell to the Romans. The battle of the Vadimonei Lake (399) put an end to the Etruscan empire, and it did not re-establish itself for another two centuries; still the prosperity of the Etruscan cities far exceeded that of Rome itself. Henceforward Etruria is finally merged in the Roman state.

Etruscan Antiquities

The large recent discoveries of Etruscan objects have not materially altered the conclusions arrived at a generation ago. It is not so much our appreciation of the broad lines of the manners and arts of the Etruscans that has advanced as our understanding of the geographic and social causes which made them what they were. One great difficulty in the study of the remains is that a very large portion of them have been found by unofficious excavators who have been naturally unwilling to tell whence they came, and that certain other excavations, such as those carried out by Comm. Barnabei for the Villa Giulia museum, have been carried out under conditions which help but little towards increasing our knowledge. The increase has, however, been steady, even if not all one could wish.

Ethnology. The origin of the Etruscans will most likely never be absolutely fixed, but their own tradition (Tacitus, Ann. iv. 55) that they came out of Lydia seems not impossible. Herodotus (i. 64) and Strabo (v. 218) tell of Lydians landing at the mouth of the Po and crossing the Apennines into Etruria. Thus it seems certain that though the earliest immigrants, known to the later Etruscans as the Rasena, may have come down from the north, still they were joined by a migration from the east, before they had developed a civilization of their own, and it is this double race that became the Etruscans as we know them in tradition and by their works. To give a date to the migration of the Rasena from the north, for which the only evidence is the fact that the Etruscan language is found in various parts of north Italy, is impossible, but we can perhaps give an approximate one to the coming of the Lydians or Tyrrhenians (Thuc. iv. 84; Polyb. i. 57). We may roughly say that this migration from Greece to Italy about 1000 B.C., and as the earliest imported Greek objects found in the tombs cannot be dated many generations later than this, this year may be considered as giving us roughly the time when the real Etruscan civilization began.

It has been, and still is, a common mistake to speak of the Etruscans as though they were closely confined to that part of Italy called Etruria on the maps, but it is quite certain that in the earliest stages of their development they were differentiated from the Umbrians on the north-east and the Latins on the south in ways due rather to the locality than to race or essential character. To primitive peoples open seas or deserts are a greater hindrance to intercourse than mountains or rivers, and even these did not cut off Etruria from the neighbouring regions of Italy. The Apennines that separated her from Umbria were not difficult to cross, and the Tiber which formed the boundary

1 For Barnabei's excavations see Fausto Benedetti, Gli Scavi di Narni ed il Museo di Villa Giulia (1900).

4 For the contents of the graves found by Boni in the Roman Forum (Notizie degli Scavi, 1902, 1904), with the objects represented in the plates of Montelius, La Civilisation primitive en Italie, pt. i. For the cemeteries at Novilara cf. Brito, Monumenti antichi, vol. v.
ETURIA

between her, and Latium; has been a far greater element of separation in the minds of modern authors than it ever was in reality. Narrow, not particularly wild, often shallow, such a stream can have no natural value. The great condition of the Etruscans. When Rome was founded, the river, of course could be used like a, most round, a castic as a means of defence, but, that is very different from its being a permanent barrier to the spread of a great culture. The fact that the alphabets used in other parts of Italy besides Etruria are derived from the Etruscan or from similar Greek sources, that Rome was ruled by Etruscan kings, that the temple of Jupiter on the Capitol was made by Etruscan hands (Cic. De Leg. xiv. 4; Plin. Nat. Hist. xxxv. 137), that the decorations of the temple found by Signor Massonei near Cervia (Voluti degli scavi, 1896) are of the same kind as those found in Etruria, shows that the influences which grew to its earliest development in the region west of the Tiber had a marked effect over a broader region than is usually admitted.

There is a large number of Greek and Roman authorities, among whom Pliny, Tacitus, Cassius, Livy, Tacitus, Cato, Volney, Cratias, Arretium, Cortona, Persia, Volaterrae (Volterra), Russellia, Populonum and Etrusca. That the country was thickly settled is made plain by the ruins that have been found. It was governed by kings who were elected for life, but whose power depended largely on the nobility (Dominion of the separate states of regions and on the aristocracy (Censorinus, De mort. turri, 13). Later, the office of king was abolished and replaced by the middle class, which was well suited to the government of the city. The Jews were divided into these free people, who were divided into corps (Serv. ad Aen. ii. 24), and then the slaves. There are three cities that the early organization of the people at Rome was typical of Etruria (Niebuhr, Rem. Etrus. and ed. 1-380).

A league of twelve cities is mentioned by the ancients (Livy iv. 22), whose delegates met at the temple of Volturnus, but we are not told which cities formed the league, and there can be little doubt that the list changed from time to time. A glance at the map makes clear some of the general relations of these cities to one another and to the outer world. They are well spread all over the country, and by no means only along the coast. None of the important ones is among the mountains. This means that the earliest inhabitants of the country were not trading peoples like the Mycenaean Greeks, and that the cities drew their wealth and strength from agricultural pursuits, which was well suited to the climate, the soil, and the natural resources of the whole region. The most important of the Tiber and Umbriel and Tiber, with their feeder streams, channel it in all directions. We get a hint as to the government of the cities from the fact that many of the Roman forms and apographe of offices were derived from the Etruscan (Dion. Hal. iii. 63); for instance, the various, worn by those decorated with a triumph, the luperci, scapula, the embroidered tunic (Tertull. De Carr. 15), and so to the golden bull and the pentateuch (Feust. iv. 2). "Sardri," Such things give an idea of the aristocratic basis of the government. Of the actual laws we know something else. Cicero (De dom. ii. 23) tells the story of the miraculous unceasingly by a ploughboy of a child who had the wisdom of ages, and how the child, words were written down by the Amasian folk, and became the archives and the source of the laws. Coming down to historic times, we find that their code, known as the libro dialisboma, Etrusca, consisted of various parts (Feust. s. a. "Etrusca.""). There were the libri horaeipareti (Cic. Leg. i. 5, 9), which dealt with the interpretation of the will of the gods by means of sacrifice; the libri fulgurati, which explained the messages of the gods in the thunder and lightning; and finally the libri visuales, which held the rules for the conduct of daily life—how to found cities, where to place the gates, how to take the census, and the general ordering of the people both in peace and war.

Natural Resources and Commerce—Such was the country and such the laws. The people were a warrior stock with little commercial skill. Much of their wealth was due to trade, but they were not the restless, conquering blood that goes in search of fame to distant lands. Theirs was a momentary service. That their wealth and consequent power were gathered contemporaneously with that of Greece is shown by various facts. One of these is that Dionysius of Halicarnassus, a native of Sicily after the Ionian revolt (in which his native city, took part) had been seized by Carthage and, when harried, the Etruscan (Herod. vii. 92). Their power is also shown by the fact that they made an alliance with the Carthaginians, with the result that they forced the Carthaginians (Herod. iii. 68). This union continued for many generations. The political one is shown by Aristotle (Pol. iii. 56, 57), who says that there were numerous treaties concerning their alliances and mutual rights, between the two peoples. "That the Greeks held the Etruscans in considerable dread is suggested by the fact that, Herod. (704),10th, names one of their leaders Aegus, and, under Miltiades, and are not the outlaws of Messenia, where they imagined they could escape, Volney, which, unless the epics were of very different character then what they were, were as likely to be the piratic bands of Carthaginians and Etruscans who guarded the channel. And, this explanation is strengthened by Euripides, Med. 1442, 1599, whose Medea compares herself to a Etruscan woman, who dwells on the Tyrrhenian shores. Their wealth was the source of their power. The Etruscans must in the main have been drawn from agriculture and forestry. The rich land with its many streams could scarcely have been the preferable outlet for the farming, of crops and goods, that were heavily timbered. It was...". Such accounts, that is, this, leaves no trace with the passing of time, that they sold; but, there is plenty of evidence that their country was visited by foreign traders of many lands, and that they bought largely of them, especially of metals... Metals also suggest that another source of their wealth was that of the middlemen. Their towns were the centres of exchange, where the north and west met, the south and east. They had no mines of gold or tin, but they, the carriers of tin, iron or amber from the north met in the markets of Etruria the Phoenician and Greek merchants bringing gold and ivory and the other luxuries of the East. The quantities of gold, silver, and bronze found in Etruscan tombs prove this clearly. Of these metals the only one found in unworked form, in what are practically pigs, is bronze. This in the form of os ruda has frequently been found in conjunction with their coins. The large number of metals known as os signum are not rare. Both forms are usually spoken of as the earliest forms of money, but as the os ruda generally bears no marks of valuation or of any mint, and as the os signum is far too large for ordinary circulation, it is probable that these shapes of metal are not to be considered strictly or alone, as coins, but as forms given to the alloy of tin, copper and bronze and sold by the Etruscans to foreigners for purposes of manufacture. This of course does not exclude their use as money. Where the copper for this bronze came from is not certain, but probably a great part was from the mines at Volaterrae... Still another proof is that, what the Etruscans sold was, the product of their fields or crude metals imported from the north, is the fact that though in the museum at Carthage and elsewhere, there are a few, which, and other objects which probably come from Etruria, still such objects are extremely uncommon... On the other hand, articles originally imported from the East, are very much more common in Etruria... Such are the ostrich shells from Volaterrae, the Egyptian cups from 1 For the "secrecy of the Greeks against the Carthaginians" and the Etruscan See Busolt, Gesch. d. Alterth. ii. 166. 2 Pliny (H.N. xxv. 11). He says that amber was brought by the Germans down the valley of the Po. Thence the trade-route crossed the Apennines to the Tyrrhenian Sea (Volney in Italy, Dei. 251). In the compensation of problems suggested by amber it is often forgotten that a very beautiful dark amber is found in Sicily.
Palestrina,1 the Egyptian glazed vases and scarabs found on more than one site.2 All this goes to show that the Etruscans lacked in their earlier days skilful workers in the arts and crafts.

Habits and Customs.—The lack of literary remains of the Etruscans does not prevent us from forming some idea of their habits as much as might be supposed, owing to the numerous paintings that are left. These paintings are on the walls of the tombs at Veii, Corneto, Chiusi (Clusium), and elsewhere,3 and give a varied picture of the dress, utensils and habits of the people. The evidence of many ancient authors cannot be questioned that as a race the Etruscans in historic times were much given to luxurious living. So much so in fact that VirgIl (Geor. ii. 103) speaks of the pinguis Tyrrenhus (a trumpet at the altar) and Cathulis (xxxi. 11) of the obsequia Etruscorum (v. 40) gives a succinct account in which he says that "their country was so fertile they derived therefrom not only sufficient for their needs but enough to supply them with luxuries. Twice a day they partook of elaborate repasts at which the tables were decked with embroidered cloths and vessels of gold and silver. The servants were numerous and noticeable for the richness of their attire. The houses, too, were large and commodious. In fact, giving themselves up to sensuous enjoyments they had naturally lost the glorious reputation their ancestors had won in war." This last remark shows that Diodorus recognized the important difference between the early Etruscans who built up the country and the later ones who merely enjoyed it. Naturally courtesans flourished in such a community. Timaeus and Theopompus tell how the women lived and ate and even exercised with the men (Athen. xi. 14; cf. lv. 38), habits which of course gave the Roman aristocrats many openings for attack (Plaut. Cist. ii. 3. 563; cf. Herod. i. 98; Strabo xi. 14). In dress they differed but little from the Romans, both wearing the toga and the tunic. Hats too, often of pointed form, were common (Serv. ad Aen. ii. 683), as the paintings show, but it was their shoes for which they were particularly famous. One author (Lydus, De Magistr. i. 17. 46) suggests that Romulus borrowed from Etruria the type of shoe he gave the senators, and this may well be true, though the form mentioned, the kampáugas, is of late origin. At any rate the Æthraea Tyreopolaei are frequently mentioned. From the pictures and remains we know that they had wooden soles strengthened with bronze, and that the uppers were of leather and bound with thongs.

Their occupations of trade and agriculture have been already mentioned. For their leisure hours they had athletic games including gladiatorial shows (Athen. iv. 153; cf. Livy ix. 40. 7; Strabo v. 250), hunting, music and dancing. All these are shown in the paintings, and all, with the exception of music, developed first as a part of religious service, and their importance is shown by the strictness of the rules that governed them (Cicero, De harusp. resp. ii. 23). Did a dancer lose step, or an attendant lift his hand from the chariot, the games lost their value as a religious service. An idea of the splendour of the triumphs that accompanied victorious generals and of the parades at the games is given by Appian (De reb. Punic. viii. 66) and Dionysius (vii. 92). The music that was an accompaniment of all their occupations, even of hunting (Aelian, De natur. anim. xii. 49), was mainly produced by the single or double flute, the mastery of which by the Etruscans was known to all the world. They also had small harps and trumpets.

For the regularization of all these duties and pleasures there was a calendar and time-division for the day. It is noteworthy that the beginning of the day was for them the moment when the sun was at the zenith (Serv. ad Aen. v. 738). In this they differed from the Greeks, who began their day with the sunrise, and the Romans, who reckoned theirs from midnight. The weeks were of eight days; the first being market day and the day when the people could appeal to the king, and the months were lunar.

The years were kept numbered by the annual driving of a nail into the walls of the temple of Nortia at Volatini (Livy vii. 3. 7), a custom later adopted by the Romans, who used the Capitoline temple for the same purpose. In Rome this rite was performed on the Ides of September, and it is likely that it took place in Etruria on the same date, the natural end of the year among an agricultural folk. A still longer measure of time was the sacculum, which was supposed to be the length of the longest life of all those born in the year in which the preceding oldest inhabitant died (Censorinus, De die natali, 17. 5; cf. Zosimus ii. 1). According to later writers4 the Etruscan race was to last ten sacula, and the emperor Augustus in his memoirs (Sovv. ad Bucol. i. 47) says that the comet of the year 44 B.C. was said by the priests to betoken the beginning of the tenth saculum. The earliest sacculum had been, according to Varro, 100 years long. The later ones varied in length from 105 to 123 years. The round number 100 is obviously an ex post facto approximation, and the accuracy of the others is probably more apparent than real, but if we reckon back some 900 years from the date given by Augustus we arrive at just about the time when the archaeological evidence leads us to believe that the Etruscans in Italy were beginning to recognize their individuality.

Religion.—To retrace the religious development of the Etruscans from its mystic beginnings is beyond our power, and it is unlikely that any future discoveries will help us much. We are, however, able to draw a clear, if not a detailed, picture of the worship paid to the various divinities, partly from the direct information we have concerning them and partly from the analogies which may safely be drawn between them and the Romans.

The frequency of sacrifices among them and their belief in the short duration of the race4 show clearly their belief in a good and a bad principle, and the latter seems to have been predominant in their minds. Storms, earthquakes, the birth of deformities, all gave evidence of evil powers, which could be appeased sometimes only by human sacrifice. We miss here the Greek joy in human life and the beauties of earth. The gods (nesar) were divided into two main groups, the Dii Consentes and a vager set of powers, the Dii Involuti (Seneca, Quaest. Nat. ii. 41), to whom even Jupiter bowed. They all dwelt in various parts of the heavens (Martianus Capella, De nupt. Phil. i. 41 ff.). Of the Dii Consentes the most important group consisted of Jupiter (Tima), Juno (Uni) and Minerva (Menra). In some towns, such as Veii and Falerii, Juno was the chief deity, and at Perusia she was worshipped like the Greek Aphrodite in conjunction with Vulcan (the Greek Hephæstus). This shows that though in exterior form the Etruscan gods were influenced by the Greeks, still their character and powers betoken different beliefs. An interesting point to note about Minerva (Menra) is that she was the goddess of the music of flutes and horns. The myth of Athena and Marsyas probably originated in Asia Minor, and a Pelasgian Tyrrenanian found in Argos the temple of Athena Salpinx (Paus. ii. 21. 3). The evident connexion between Asia Minor and Etruria in these facts cannot be overlooked. Besides these deities there were Veneras (Turan), Bacchus (Falamus), Mercury ( prudent. Vulcan (Settione). Ovid, Met. viii. 156, 8), Sethlans is in a way the most important, for he shows a connexion in prehistoric times between Etruria and the East.4 Other deities of Greek origin there were—Ares, Apollo, Hercules, the Dioscuri; in fact, as the centuries passed, the Greek divinities were adopted almost without exception. Besides these there were also many gods of Latin or Sabine origin, of whom little is known but their names; these may often be local appellations for the same god. Among these were Volturnus at Volatini and Vertumnus at Rome, Janus, Nortia, goddess of Fortuna, Feronia, whose temple was at a town of the same name at the foot of Soracte,7 Mantus, Pales, Vejovis, Eleithyia and Ceres.

5 Martianus, De Dies Nat. 17.
6 See Preller, Röm. Myth. a.v. "Vulcanus." Opposed to this see Wissowa, Religion u. Kultus der Römer, who seems to misinterpret the evidence.
7 Strabo v. 2. 39; cf. Livy i. 90; Dion. Hal. iii. 32.
Such were the leading gods; in addition there was the world of spirits whom we know in Rome as the Manes, Laris and Penates. The latter were of four classes, pertaining to Jove, Neptune, the gods of the lower world, and to men. The Laris too were of various sorts (familiaris, compitales, stales), and with them the souls of the dead, after the performance of due expiatory rites, took the form used by the vatic animales (Serv. ad Aen. iii. 676 and 702). The Manes are the vaguest group of all and were confined almost wholly to the lower world (Festus, s.v. “Mundus”; Apuleius, De deo Sacratiss.). Over all these ruled Mantus and Mania, the counterparts of Pluto and Persephone in Greece. As a result of this complete hierarchy of divine powers the priesthood of Etruria was large, powerful, and of such fame that Etruscan horaspias were sent for from distant places to interpret the sacrifices and the oracles (Livy v. i. 6, xxvi. 37. 6).

Art.—The evidence drawn from tradition and custom which we have so far considered in relation to the origin and beliefs of the Etruscans has taken us into the prehistoric times much earlier than those when the handicrafts developed into true fine arts. The contents of the earliest graves show but few traces of any feeling for art either in architecture or in the lesser forms of household and personal decoration. Gradually, however, as one comes down towards the more historic periods, certain objects, obviously imported from the eastern Mediterranean, occur, and these are the first signs of an interest in the beauty or curiosity of things, an interest that local workmen could not yet satisfy, but which stirred them to endeavour. It was probably during the 9th century that this began, not long after the period when foreign trade began to flourish.

The history of Etruscan art has usually been wrongly estimated owing to the widespread opinion that objects found in Etruria were in the true sense products of native artists and indicative of native-grown culture. It is only recently, and not even yet completely, that the term “Etruscan” has been given up as the name for the terra-cotta vases (which were found in the 19th century by the earlier archaeologists of the modern scientific school in great quantities in the Etruscan tombs); these are now known to have been made by Greek potters. There are few books on the subject of Etruscan art. The best known is Jules Martha’s L’Art Etrusque (2nd ed., 1886), a book which, though full of accurate data, shows absolute lack of discrimination between those works that are of Etruscan fabric and those that were brought from other lands, particularly Greece and the Greek colonies of Magna Graecia and Sicily. These latter are too generally forgotten in the study both of Greek and of Etruscan art, and all works which show the Greek spirit are vaguely supposed to have been produced on the Greek mainland.

Architectura.

House construction, but give no suggestion that the Etruscans had any artistic sense in architecture. Such tombs are mostly, later than the 5th century b.c., and show the most simple form of wood construction. Posts or columns hold up the walls and the sloping roofs, the latter made of beams with boards laid lengthwise, covered by others from ridge to eave, the intervening space forming a coffer, sometimes decorated. Though the walls of such tombs are often covered with paintings, the relation of the various parts (and, let it be remembered, these tombs represent the houses of the living) shows but the coarsest sense of proportion. The elements of the decoration, such as capitals, mouldings, rossettes, patterns, are borrowed from Greece, Egypt or elsewhere, and are used redundantly and with no refinement.

The temples did not differ from those in Greece in any essential principal of construction except that they were generally square, from the desire to make them answer to the temple or quadripartite division of the heavens elaborated by the sages. In Roman times “Etruscan style” was the term used for colonnades with wide intercolumniations, and this shows how the early builders used wood with its possibility of long architrave beams rather than stone as in Greece. The interior arrangements of the temple also varied from the Greek models, for owing to the fact that the gods of Etruria were often worshipped in groups of three the cela was divided into three chambers. The decoration—metopes, friezes, acroteria, &c.—was of terra-cotta fastened by nails to the wooden walls.

Though we know that the Etruscans were famous for their games, still there are no remains of cirei, and so too, though the satyriatae were well known, no theatres are left. They were obviously a race of no literary taste or culture. The theatre at Fiesole which is often referred to as Etruscan, unquestionably, dates from Roman times.

Underground tombs have already been mentioned in their relation to house-architecture, but there are the tumuli such as that called la Cucumella at Volci, that of the Curiatii at Albano, or that of Porsena at Clusium, which Pliny describes as one of the wonders of Italy (H. N. xxxvi. 19). These great walled-in mounds with their complex of interior chambers are interesting as reminiscent of tombs in Lydia, but architecturally they are barbaric and show no developed skill.

There remains one monument which has always been supposed to show a real advance made by the Etruscans in the art of architecture—the cloaca maxima in Rome. This round-arched drain was supposed to have been built by Etruscans, and it was only in 1903 that Commendatore Boni in excavating the Forum proved that the drain was originally uncovered, and that the arch was built at the end of the Republic. Thus the honour of discovering the arch, for it was known to the East, but of popularizing its use, does not belong to the Etruscans, though they did use it at a comparatively late time for city gates, as at Volterra. The false arch and dome of the Mycenaean seems to have been familiar to them, though there are but few cases of its use on a large scale. The best-known instances are the Tullianum or Mamertine prison in Rome, the Regolini-Galassi tomb at Cervetri, one at Sexto Fiorentino near Florence, and Cortona at Chiusi, and also those at Latium. Although there was, therefore, but little development in the greater arts of literature and architecture among the Etruscans, it is evident enough that there was much desire to possess the products of the lesser arts, such as sculpture, jewelry and household ornaments. But here too the study has been made difficult by the failure to distinguish between native and imported products. Before studying the objects themselves it is well to recall the legendary character of Etruscan chronology as of the Tomne.

For an illustration of the Corneto tomb see Architecture, vol. ii. P. 389.}

reckoned in secunda. Helbig showed that we cannot consider any of the traditional dates as being accurate until about 644 B.C., the beginning, that is, of the fifth aeculum. This is probably about one hundred years after the introduction of the Chalcidian (Ionic) alphabet into the country. One of the earliest examples of the use of this alphabet in Etruscan inscriptions is found in this form.

In considering the trade of the country it has been pointed out that its chief political connexions were with Carthage, but the artistic sense of Carthaginians or other Phoenicians was not more developed than that of the Etruscans. They were traders, and doubtless brought the Etruscans some of the Egyptian and Eastern objects which have been found in their tombs, articles that date from the 7th and 6th centuries B.C. But beside the Phoenician Greeks of the 6th century had been trading and colonizing in Sicily and Italy. Herodotus (i. 163) tells how the Phocaeans were the first of the Greeks to take long voyages, and that they discovered the Adriatic and Tyrrhenian seas and Iberia. Thucydides (vi. 3) says that it was Chalcidians from Euboea who first settled in Sicily. Pliny (Hist. Nat. xxxv. 12. 43) writes in the same sense, for he tells of Demaratus who came from Corinth with the artists Eucheir, Diopius, Eugrammus, about 600 B.C., and first started sculpture in Italy. These achievements of the coming of Ionian Greeks to Italy are completely borne out by the archaeological remains found in Ionian lands and in Etruria, and it is agreed that a great part of what has hitherto been considered Etruscan is no more Etruscan than the Moorish plates of the 13th century found in Italy are Florentine. The best works in most of the smaller arts are almost without exception Greek, the earlier Ionian, the later Attic; the remainder are made with the distinct intention of imitating Greek models, and so should be considered as Greek, inasmuch as they do not show a natural, original expression of feeling on the part of the Etruscan workman. The Etruscans were dull artists in all lines. They were skilful copyists, nothing more, as is absolutely proved by the simple fact that we know of no Etruscan artist by name. If one takes the articles which are of obviously local manufacture, such as the burial urns or the ordinary bronze mirrors, or the pottery, it would be hard to find a similar quantity of work by any other race so lacking in originality of conception or high excellence of technique.

It is the study of the monuments a division must be made distinguishing between the obviously Greek works, the works done with a desire to copy Greek models and the work of native artists. To separate the objects in the way suggested required a very considerable familiarity with Greek art, and though in many cases the result may be doubtful, still so much must be taken from the Etruscans that they are shown to have little more artistic feeling than the Romans. In the earlier centuries a strong eastern influence appears in the copying of sphinxes and similar eastern motives, but this soon gave way to the stronger Greek influence, as was natural, for the intercourse with the Phoenicians was spasmodic whereas that with the Greeks was constant. But even with the Greeks to kindle their imaginations, the Etruscans produced no school of art; no steady progression is traceable. In various towns there were various fashions of pottery or jewellery, but good, bad and indifferent constantly occur together in a way possible only among a people who possessed no natural artistic capacities and had no widespread standards of cultivated taste. The Ionians have been mentioned as having strongly affected the arts in Etruria; and though in the later centuries Athens undoubtedly exerted heavy consignments to Italy, the taste of the Etruscans seems generally to have preferred the rather heavy loose style of the fashion, even when direct contact with them was lost and its place taken by direct relations with Athens and her colonies.

Pottery practised enormously by the Etruscans shows as clearly as possible their essential strength and weakness as a race. though it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscan style of pottery was not the most original, yet it is true that the Etruscans and the vase form goes. It is evident from comparisons with early Ionian vases that the better proportioned of the shapes are direct copies of the Ionian. The decoration of the bucchero is either engraved, in which case it is almost always extremely rude, or formed by figures modelled or pressed by a mould on to the body of the vase. In these two last cases the figures are often suggestive of the farther East (Egyptian and Mesopotamian), but still more frequently they are taken from Greek originals, and the natural tendency of the Etruscan artist to imitate is very marked. Whence the moulds for these vases came is not known, but analogies with other classes of work makes it practically certain that some were imported and some made by the imitating workmen. There are other classes of vases which at first sight look as though they were imported from Greece but, by the nature of their clay, are recognized to be Etruscan imitations of Greek originals. The imitation is often very skilful, for the Etruscan artist rivalled his Greek model in deftness of hand, if not in imagination. Such, for instance, are the large amphorae decorated with bands of animals in the Corinthian style. Besides these native vases the tombs have yielded great quantities of others which were to be called Etruscan, but are now known to have been imported from Greece. Until the 6th century B.C. these vases were mostly Ionian, but at that time the trade of the Phocaeans was waning before that of Athens, and henceforward the Athenian ware is the commonest. Intercourse with Athens, however, came to an end about 480, when the Sicilian Greeks mastered the trade of the western Mediterranean, so that in the Etruscan tombs later than this date we find fewer and fewer imported vases, and more and more native imitations. It is generally taken for granted that these Attic vases were brought to Etruria by Greek traders, but considering how little the Greek historians, even Herodotus, knew of that country, this is unlikely. Then, too, the chief products of Etruria had to give Greece were metals, so it is more likely that it was the Etruscan traders who, having carried metal to Greece (where Etruscan bronzes were famous), brought back the vases.

Though most collections make no distinction between Greek and Etruscan scarabs, the differences, though slight, are quite certain, and consist in the greater elaboration of the borders, edges and backs of the Etruscan examples. The commonest material was imported, and the scarabaei are usually made of different materials, and often of bone. That the scarabaei were worn as ornaments—is in the decoration of necklaces. What we learn from them merely serves to strengthen what we learn from the pottery—that the Etruscans were dependent on the Greek world for their artistic conceptions. Though many Etruscan gems (in fact, scarcely any other kind) have been found in Sardinia, these are comparatively rare in Etruria, where the earliest gems occur about 650 B.C. Some of these earliest show the Ionian influence, which is also shown in certain gold rings, but most of them represent the Attic style as seen on the black-figured vases of Athens. To understand them one has but to know Attic sculpture, the complete history of which is repeated in these small and beautifully worked stones. At first one finds the single figures, awkward in form and modelling, but full of life in composition—one finds the same mistakes in anatomy (i.e. the muscles of the stomach); and then come the figures beautifully worked and accurately observed, but with the slight hardness and rigidity that belongs to all pre-Raphaelite work; and finally one sees the figures carved with the easy assurance of the master.
sometimes single, sometimes in groups, but always Attic in their unrivalled representation of the beauty of the human figure, and in the innumerable lovely scenes taken from everyday life. Not infrequently inscriptions are cut in the gem, but these are not as on Greek gems the name of the carver or the owner, but the name of the Greek hero represented. In regard to technique, one point is specially noteworthy. Many of the gems are carved with the second drill, and the dishes made by this are not modeled into any real semblance of a figure. This is not seen of the antiquity of the gem, for there are examples in which together with this method will be seen a figure finished with the greatest care, it is thus evident that the gem-cutters left the marks of their work drill because of their decorative value. This they undoubtedly possess, and it is one of the few cases in which the Etruscan showed any art sense.

Brass. - Weapons of course were fashioned of it, but these are simple in shape and decoration; no such examples as those from Mycenae, etc. are known.

Bronze. - Objects of large size as the bronze doors of Veii, the chariots of Perugia in the New York museum, or large tripods or shields, show that the artificers had large quantities of the material at their disposal. As with the vases or gems, so in these metal objects the distinction must be drawn between pure Etruscan work and the work that was done by Greek workmen or by Greeks copying the Greek style. As Etruscan art has been wrongly estimated through forgetfulness of the Greek influence, so Greek bronzes have probably received credit that does not belong to them. Etruscan candelabra and vases were famous among the Greeks (Ath. i. 28; 6; 700 c.). The chariots mentioned above and the tripods in the Harvard museum are plainly Greek; the round shield with ornament in bands is native. Antefaces of tombs were of bronze, and in some cases the eyes of the figures were inlaid with glass paste. The best-known articles of bronze are the mirrors, which are very dependent on Greece for their models, though the poor style in which the scenes that decorate them show in most cases carved shows that these articles of common use were produced, as was natural, mainly by ordinary workmen. In rare cases the figures are not engraved but are given in low relief. These mirrors seem to have been mainly intended for women, and the scenes on them in large numbers of cases are of such a character as to bear out this idea; for instead of scenes of battle such as occur on the gems, scenes with satyrs and maenads are common, or the story of Helen or the labours of Hercules. So far as development goes they pass through the same stages as the gems, though owing to their larger surface they are more generally decorated with groups of figures. Another well-known class of work is the cistae or cylindrical bronze boxes found mostly at Fiesole and Placentia, where the scenes to which they have been compared do not correspond in the same character as those on the mirrors, and it is noteworthy that these figures are often better in style than the figures modeled in the round that serve as handles, or than the legs which also are modeled. This, taken together with the fact that the same figures are repeated in several cases on more than one gem or mirror, makes it probable that the workmen, like the later potters of Eretria, had a stock of models brought from Greece and repeated as occasion served their fancy. The paintings and contents of the tombs have made it plain that the wealth of the Etruscans was very considerable, and that they spent much on jewelry, gold and silver. Their extravagance in this regard was well known, and the rings, the necklaces, the diadems, the bracelets and the earrings show that there was a large class of well-to-do people.

The eastern and Greek influences are clearly marked in the figures used in decoration, and in certain shapes of rings, but in

4. Klugmann-Körte, 107, 131, 156.
5. Gold and silver, pp. 164; Ovid, Am. iii. 13. 25 sqq.

one technical matter, the Etruscans seem to have made a discovery: it was in the use of the instrument, that is, ornament made by soldering on to the gold object innumerable small globules of the same metal laid in various designs and patterns, each globule soldered by its self. Though this style of ornament occurs in Egypt, Cyprosc, Rhodes and Magna Græcia, nowhere is it accomplished with such extraordinary dexterity as in Etruria that they never did otherwise.

The difficulty of it seems to have pleased them, for it is commensurate with the earlier filigree work made of wire soldered on to the gold base. Reference has been made to the scarabæi ornament in the gold necklaces, and similarly we find another used and in the later work, precious stones and pearls.

As an instance the Etruscans first carved their figures out of wood, not of wood, but what these figures were like we can only imagine. The earliest known figures in the round are recent. The earliest known carvings in the round are recent. Sculpuli, semicircular, than the contemporary Greek work: the early attempt at a female bust is not made by casting but by riveting plates of bronze together. A half-life bust in the Tyszkiewicz collection was probably about 560 B.C. and is solid. Later they learned the art of hollow casting, but their attempts to reproduce figures in the round are generally lacking in skill. One reason for this was the lack of good marble; the quarries at Carrara not having been used until Roman times, so that it was the most extraordinary work of skill in 'modelling' and colouring, this was great. The earlier statues of large size have perishéd but there are three famous sarcophagi which show the work of Italian Etruscan artists; one is in the British Museum, one in the Louvre and one in the Villa di Papa-Oliva at Rome. The elaborate detail and careful work, the type of the figures and the style of their dress, point to the same Ionic origin as that of the bronze chariots already mentioned. The type of sarcophagi illustrated by these examples became very common, and in the figures that decorate the cover can be traced the various influences that affected the whole of Etruscan art. In an example from Veii the later Attic influence is strongly marked. Such work shows little power of originality, but much of the interest taken by careful workmen by copying carefully, and the tendency that such workmen almost invariably display of overlapping the subject with too much ornament and detail. The small scholars, either of stone or terra-cotta, are in certain ways more interesting than the more elaborate sarcophagi, for on these urns the heads of the figures receding on one side which form the usual decoration of the covers are often obvious attempts at portraiture. Single busts show this same desire for accurate likeness of the persons represented, and in this one line of art the Etruscans showed a new feeling; one that found its first expression in the hands of the later Roman portraitists. The main difference between these sculptors and the Greek artists is that the sculptor of his subject as illustrating character that showed itself in ways of repose and thought, the essential, lasting individuality. The Etruscan and Roman portraitist thought, on the other hand, of his subject as illustrating character in ways of action; hence pure Etruscan and Roman portraits are much more intense in line, and the expression of the eye is not dreamy but distinctly focused. They are different, but, as art, one is as fine as the other. The scenes on the sides of these urns are not mere cases of the gems and mirrors, very frequently taken from Greek story, and often are scenes of battle. Work in relief for the friezes and the other decorations of temples was very common, and shows remarkable skill in the mere processes of modelling and 'hacking' the slabs of terra-cotta that were fastened by nails to the beams. So far as the figures themselves are concerned, they seem to have but little meaning in connexion with the building they decorate.

ETURIA

Satyrs and maenads, chariot-races and such scenes taken over from Greek models are perhaps the commonest. In none of the obviously native work is there any more instinctive feeling for the greater qualities of sculpture than in the gems. Little is original, almost everything dependent on earlier masters. There is no absorption of the artist by his work which produces great work, great because the beholder thinks rather of the work produced than of the artist who produces it. For this reason such figures as the bronze Athena in the Florentine museum are presumably not Etruscan but Greek.

There is no evidence that the Etruscans had easel-paintings like the Greeks, but their skill in painting is well illustrated by the pictures with which they frequently covered the inner walls of their tombs. The wall was prepared with a coating of fine white stucco on which the figures were painted with a large variety of tints. The best of them have been found at Tarquinii, Chiusi, Volci, Caere, Veii.\(^1\) The paintings exhibit the usual Greek influences. They show a certain ponderous realism, but as works of art they are of little value. As pictures of the life and customs of the people they are of great importance.

As works of art their coins\(^2\) are the worst efforts of the Etruscans. Gold, silver and bronze were used, but no examples can be dated earlier than the beginning of the 5th century B.C. The coins are struck according to four different standards of weight, due perhaps to different trade-connexion. The bronze coinage shows a distinct scale of reduction in weight due to the increasing use of the precious metals. Many examples show a design only on one side. The designs of the majority of the types are taken from Greek models, but strangely enough the die-cutters show no such skill as that of the makers of gems.

Arms and Armour.—In the early periods the chief weapons (besides bows and arrows which bore flint or bronze heads) were few and simple, and were of bronze. Iron ones have been found, and their rarity is doubtless partly due to their having rusted away. Spears of various weights were common and also swords and daggers. These latter had straight two-edged blades with the handle either of the same piece or of some other material fastened on with rivets. The blades of the daggers are generally engraved with lines and zigzags. Shields were of circular and oval shape. These two were of bronze, the round ones decorated in Hebrew fashion with concentric circles of ornament, the motives being geometric patterns or an animal repeated endlessly. Breastplates with overlapping shoulder-straps and belts, broader in front than behind, with decoration of the same kind as the buccero vases, are not uncommon. Greaves and helmets completed their equipment. The former seem to have been less ornate than those the Greeks wore; the latter were of various shapes, the commonest being round caps with a knob on the top, or a deeper shape with a crest from front to back. Some are shown with side-pieces raised like wings, but these are perhaps merely cheek-pieces raised on hinges. In later times they had trumpets and axes, and their arms became practically the same as the Roman, as one sees from the representations in the tombs.

**LANGUAGE**

1. By “Etruscan” is meant the language spoken by the people called Etrusci (more commonly Tusci) by the Romans, Tuscum numen (i.e. Tuscum nomen) by their neighbours the Umbrians of Iguvium (q.v.), and Turopoll (later, e.g. in Strabo’s time, Tooppol) by the Greeks. Their own name for themselves was Rastna (or Rastna), according to Dionysius Halic. (i. 30), but it seems now to be fairly generally used as that of the country rather than the name of a leading house (represented later on in Pisa and elsewhere) dominant at some fairly early date in some one

\(^{4}\) Mon. Dell’ Inst., Handbuch of Greek and Roman Coins; Deecke, Etruskische Forschungen; also article NUMISMATICS.

\(^{6}\) The Etruscan script and the supposed Hellenic influence. See Mon. dell’ Inst., Handbuch of Greek and Roman Coins; Deecke, Etruskische Forschungen; also article NUMISMATICS.

weight of the evidence appears to be distinctly in favour of the Etruscan character of the language, and Pauli's view is now generally accepted by students of Etruscan; hence the inclusion of the inscription in the Corpus Inscrip. Etruscarum.

4. The first attempt to interpret Etruscan inscriptions was made by Phil. Buonarroti (Spéc. et confect. ad monum. R., Florence, 1726), who, as was almost inevitable at that epoch, tried to explain the language as a dialect of Latin. But no real study was possible before the discovery of the alphabet of Lepelus (Insc. Umb. et Osceae, Leipzig, 1841), and his discovery that five of the Tables of Iguvium (q.v.), though written in Etruscan alphabet, contained a language akin to Latin but totally different from Etruscan, though some of the non-Italic peculiarities of Etruscan had been already pointed out by Otfried Müller (Die Etrusker, Breslau, 1838). The earliest inscriptions, e.g. the terra-cotta stele of Capua of the 5th century B.C., are written in "serpentine bestowed," but in its common form of the 3rd century B.C. the alphabet is retrograde, and has the following nineteen letters:—

O Q R S T U V W X Y Z

On older monuments Q occurs as an archaic form of c; Q is a sibilation of some kind and Q is the last mostly in foreign words. In the earlier inscriptions the cross-bars of e and o have a more decidedly oblique inclination, and i often serves for n. The mediae b, g, d, though they often occurred in words handed down by the Etruscans, are never found in the Etruscan inscriptions, though the presence of the mediae in the Umbrian and Etruscan alphabets and in the abecedaria shows that they existed in the earlier form of the Etruscan alphabet, O is very rare. The form (earlier [ ]) in south Etruscan and Faliscan inscriptions should also be mentioned. Its combination with B shows that it had once served to denote the sound of digamma just as Latin F. The varieties of the alphabet in use between the Apenines and the Alps were first examined by Mommsen (Inschriften nord-etruskischen Alphabets, 1853), and have since been discussed by Pauli (Alltische Forschungen, 1883-1884, p. 373), in which features of some living dialects of the Caucasus are cautiously compared by Prof. V. Thomsen (as independently by Pauli, see § 12), is the present, and as to the numerals probably misleading. Worst of all was the effort of W. Corson (Die Sprache der Etrusker, 1853), in whom learning and enthusiasm were combined with loose methods of both epigraphy and grammar, to revive the views of Buonarroti. The only solid achievement in the period of Corson was the description of the works of art (tombs, vases, mirrors and the like) from the different centres of Etruscan population; Denzau's Cities and Cemeteries of Etruria (ed. 1st, 1848; and 2nd, 1898) contributes something even to the study of the language, because many of the figures in the scenes sculptured or engraved bear names in Etruscan form (e.g. wus, "son"; or of the sun, on the temple of Placenta; fijand, "Bacchus"; tsoyayal, a demon or fury; see Denis, Cities, cit. and in the inscription known as the text of Duke, and 354).

6. The reaction against Corson's method was led first by W. Deecke, Corson and de la Brosche (1876). Etruscanische Forschungen (1875-1886), and continued by Carl Pauli at first jointly with Deecke and afterwards singly with greater power (Etruscanische Studien, 1873). Etr. Forschungen u. Studien (Göttingen-Stuttgart, 1881-1884), Alltische Studien (Hannover, 1883-1887); Alltische Forschungen (Leipzig, 1887-1894). Of the work achieved during the last generation by him and the few but distinguished scholars associated with him (Danielsson, Schaefer, Skutsch and Torp) it may perhaps be said that, though the positive knowledge yet reapèd is scanty, so much has been done in other ways that the prospect is full of promise. In the first place, the only sound method of dealing with an unknown language, that of interpreting the records of the language by the evidence of the records of the language by the use of imaginary parallels in better known languages whose kinship with the problematic language is merely assumed), has been finally established and is now followed even by scholars like Elia Lattes, who still retain some affection for the older point of view. By this means enough certainty has been obtained on many characteristic features of the language to bring about a general recognition of the fact that Etruscan, if we put aside its borrowings from the neighbouring dialects of Italy, is in no sense an Indo-European language. In the second place, the great undertaking of the Corpus inscriptionum Etruscarum, founded by Carl Pauli, with the support of the Berlin Academy, conducted by him from 1893 till his death in 1901, and continued by Danielsson, Herbig and Torp, for the first time provided a sound basis for the study in a text of the inscriptions, edited with care and arranged according to their provenance. The results of their labours are contained in a thousand pages from the northern half of Etruria. Thirdly, the discoveries of recent years have richly increased the available material, especially by two documents each of some length. (1) The 5th-century stele of terra-cotta from S. Maria di Capua already cited, published by Buecheler in Rhein. Museum, lv., 1900, p. 1 and now in the Royal Museum at Berlin, is the longest Etruscan inscription yet found. Its best preserved part contains some two hundred and fifty continuous lines, the first of which the third may be cited in the reading approved by Danielsson and Torp, and with the division of words adopted by Torp (in his Bemerkungen zur einr. Inschr. von S. Maria di Capua, Christiania, 1905), to which the student may be referred. (2) The lineal wrappings of an Egyptian mummy (of the Ptolemaic period) preserved in the Agrum Museum were observed to show on their inner surface some writing, which proved to be Etruscan and to contain more than a thousand words of largely continuous text (Krall, "Die etrusischen Mumiienbinden des Agrum. Museums," Denkschr. d. k. Akad. d. Wissenschaften, 41, Vienna, 1892). The writing has probably nothing to do with the mummy as it is on the inner surface of the bands, and these are torn fragments of the original book. The alphabet is of about the 5th century B.C.

7. From the recurrence of a number of particular formulae with frequent numerals at intervals, the book seems to be a liturgical document. Torp has pointed out that the two documents have some forty words in common, and, with Lattes ("Primi Appreniti alla grande iscriz. Etrusca", in Renord's Revue Insil. Lomb., serie ii, vol. xxxviii., 1900, p. 345 ff.), has shown that both contain lists of offerings made to certain gods (among them Suri, Lemum, and Skutsch), which gives considerable addition to the plausible conjecture as to the occasions of the offerings, based on the phrase "Beryca medali" or "Neptum statua" (or "statue pair") Torp has made it very probable that the words sii and sun, which recur at regular intervals in both, mean "address," "rectifi," "pray," or the like, preceding or following spoken parts of the ritual.

Along with the growth of the material, some positive increase in knowledge of the language has been attained. Independently of the work done upon particular inscriptions, such as that which has been described above, there is also an elaborate study of Latin proper names already mentioned by Prof. W. Schule (Berlin (Zur Geschichte lateinischer Eigennamen, Berlin, 1904), which has incidentally embodied and somewhat extended the points of Etruscan nomenclature previously observed. These results for our purpose may be briefly stated. It will be convenient to use the following terms:—

(1) praenomen = personal name of the individual.
   e.g. Vel or Lar of a man, Laris or Lars of a woman.
(2) nomen = family name.
The page is an excerpt from a book discussing the history and culture of the Etruscan civilization, focusing on the etymological and linguistic aspects of their language and society. The page includes a discussion on the word "nomina" and its relation to the Etruscan language, mentioning "nomina" in the plural "nominae". It also refers to "Grimm" and "Hanson" in Latin spelling, and mentions "nominis" and "nominae". The text discusses the etymology of the word "nominae" and its relation to other languages, including Latin and Etruscan. The page includes references to "Lexicon," "suffices," and "suffixes" in the context of language and etymology. The page also mentions "Latin," "Etruscan," and "Greek" in relation to the language and culture of the Etruscans. The author references "Skrutskis" and "Schaefer" in their work on the language. The page ends with a historical note on the Etruscan civilization, mentioning "triumph" and "conquest."
Its industries include the manufacture of tobacco, soap and leather, and there is a considerable trade in agricultural produce. Founded in the 8th century by Eddo, bishop of Slesvig, the town of Ettingshausen, which lies on the left bank of the Rhine at the point where the Eder and Fulda rise, was at that time called Eddo and in 804 it received the Romanesque form of the church. The Benedictine abbey of Ettenheim, which was founded in the 8th century and which was dissolved in 1803, occupied a site south of the town.

ETTINGHAUSEN, CONSTANTIN, Baron von (1826-1899), Austrian geologist and botanist, was born in Vienna on the 26th of June 1826. He graduated as a doctor of medicine in Vienna, and became in 1854 professor of botany and natural history at the medical and surgical military academy in that city. In 1857 he was chosen professor of botany at Graz, a position which he occupied until the close of his life. He was distinguished for his researches on the Tertiary flora of various parts of Europe, and on the fossil floras of Australia and New Zealand. He died at Graz on the 1st of February 1897.

ETTINGHAGEN, E. von, a man of Germany, in the grand-duchy of Baden, on the Alb, and the Ortenau, mentioned in the Black Code of 1443, 64 S., of Karlsruhe. Pop. (1895) 8046. It is still surrounded by old walls and ditches, and presents a medieval and picturesque appearance. Among its more striking edifices are an old princely residence, with extensive grounds, an Evangelical and two Roman Catholic churches, and the buildings of a former monastery. There are also many Roman remains, notable among them the "Neupfarr," sculptured, now embedded in the wall of the town-hall. Its chief manufactures are paper-making, spinning, weaving and machine-building. The cultivation of wine and fruit is also largely carried on, and in these products considerable trade is done.

The first notice of Ettinghausen dates from the 8th century. It became a town in 1227, and was presented by the emperor Frederick II. to the margrave of Baden. In 1669 it was pillaged by the French, and near the town Morpurp, defended the archduke Charles and 19th of June of that year. See Schwarz, Geschichte der Stadt Ettinghausen (Karlsruhe, 1899).

ETTMÜLLER, ERNST MORITZ LUDWIG (1862-1877), German philologist, was born at Gersdorf near Lobau, in Saxony, on the 3rd of October 1862. He was privately educated by his father, the Protestant pastor of the village, entered the gymnasium at Zittau in 1876 and studied from 1873 to 1876 at the university of Leipzig. After a period of about two years during which he was partly abroad and partly at Gersdorf, he proceeded to Jena, where in 1873 he delivered, under the auspices of the university, a course of lectures on the old Norse poets. Three years later, he was called to occupy the mastership of German language and literature at the Zürich gymnasium; and in 1863 he left the gymnasium for the university, with which he had been partially connected twenty years before. He died at Zürich in April 1877. To the study of English Etzmüller contributed by an alliterative translation of Beowulf (1840), an Anglo-Saxon chrestomathy, entitled Engle und Sczena scapcs and boecars (1850), and a well-known Lexicon Anglo-Saxonum (1851), in which the explanations and comments are given in Latin, but the words unfortunately are arranged according to their etymological affinity, and the letters according to phonetic relations. He edited a large number of High and Low German texts, and to the study of the Scandinavian literatures he contributed an edition of the Volsunga (1851), a translation of the Lieder der Edda von den Nebelungen (1857) and an old Norse reading book and vocabulary. He was also the author of a Handbuch der deutschen Literaturgeschichte (1847), which includes the treatment of the Anglo-Saxon, the Old Scandinavian, and the Low German branches; and he popularized a great deal of literary information in his Herstâlichen und Winterstudien: herausgegeben von der Deutschen Dichter- und Schulanstalt in Leipzig, which he edited for a number of years. He was also the author of a notable work on the "Deutscher Sprachkreis," the alterations and transfers which he admired in the old German period he himself employed in his Deutsche Stammbücher (1844); and Das verbaehrweilnde Zunehm, oder Karl der Große und der Heilige Geist (1852).

ETTMÜLLER, MICHAEL (1644-1683), German physician, was born at Leipzig on the 20th of May 1644, studied at his native place and at Wittemberg and after travelling in Italy, France and England was recalled in 1665 to Leipzig, where he was admitied a member of the faculty of medicine in 1667. About the same time the university confided to him the chair of botany and appointed him extraordinary professor of surgery and anatomy. He died on the 9th of March 1683, at Leipzig. He enjoyed a great reputation as a lecturer, and wrote many tracts on medical and chemical subjects. His collected works were published in 1706 by his son, Michael Ernst Etzmüller (1663-1732), who was successively professor of medicine (1709), anatomy and surgery (1706), physiology (1710) and pathology (1714) at Leipzig.

ETTRICK, a river and parish of Selkirkshire, Scotland. The river rises in Capel Fell (2233 ft.), a hill in the extreme S.W. of the shire, and flows in a north-easterly direction for 32 m. to its junction with the Tweed, its principal affluent; being the Tweed. In the parish of Ettrick were born James Hogg, the "Ettrick shepherd," (the site of the cottage being marked by a monument), and Robert Burns. Ettrick was one of the most picturesque parishes in Scotland, and the old keepers of the famous inn at the head of St Mary's Loch, both of whom are buried in the churchyard, and Thomas Bonton (1753-1757), one of the founders of the Kelaitherch. About 2 m. below Ettrick church is Thirlstane Castle, the seat of Lord Napier, and Ettrick, a descendant of the Napiers of Merchiston, and beside it is the ruin of the stronghold that belonged to John Scott of Thirlstane, to whom, in reward for his loyalty, James V. granted a shield of arms as a crest, and the motto, "Ready, aye ready." Two miles up Raeburn Burn, a right-hand tributary, lies the site of Buccleuch, another stronghold of the Scotts, which gave them the titles of Earl (1649) and Duke (1665). Only the interest fragment remains of Tushielaw tower, occupying high ground opposite the confluenence of the Raeburn and the Ettrick, the home of Adam Scott, "King of the Border," who was executed for his misdemeanours in 1552. Lowesdown Castle, near Coldstream, is in the parish. The Ettrick Water rises in the "Lay of the Last Minstrel." If the name goes from the Gaelic doil Orain, "Orain's field," the district was probably a scene of the labours of St Oran (d. 548), an Irish saint and friend of Columba. It seems that Sir Walter Scott's rhythm has caused the accent wrongly to be laid on the last, instead of the penultimate syllable. Carterhaugh, a corruption of Carehaugh, occupying the land where Ettrick and Yarrow meet, was the scene of the battle of "Young Tamline," and of the historic football match in 1815, under the auspices of the duke of Buccleuch, between theburghers of Selkirk, championed by Walter Scott, sheriff of the Forest (not yet a baronet), and the men of Yarrow vale, championed by the Ettrick shepherd...

ETTY, WILLIAM (1787-1849), British painter, was born at York, on the 10th of March 1787. His father had been in early life a miller, but he finally established himself in the city of York as a baker of spice-bread. After some scancy instruction of the most elementary kind, the future painter at the age of eleven and a half left the paternal roof, and was bound apprentice in the printing-office of the Hull Packet. Amid many trials and discouragements he completed his term of seven years' servitude, and having in that period come by practice, at first surreptitious, though afterwards allowed by his master "in lawful hours," to know his own powers, he removed to London.

The kindness of an elder brother and a wealthy uncle, William Etty, himself an artist, stood him in good stead. He commenced his training by copying without instruction from nature, models, prints, &c.,—his first academy,—as he himself, says, being a
plaster-cast shop in Cock Lane, Smithfield. Here he made a copy from an ancient cast of Cupid and Psyche, which was shown to Opie, and led to his being enrolled in 1807 as student of the Academy, whose schools were at that time conducted in Somerset House. Among his former pupils were those who in after years rose to eminence in their art, such as Wilkie, Haydon, Collins, Constable. His uncle generously paid the necessary fee of one hundred guineas, and in the summer of 1807 he was admitted to be a private pupil of Sir Thomas Lawrence, who was at the very acme of his fame. Etty himself always looked on this privilege as one of incalculable value, and till his latest day regarded Lawrence as one of the chief ornaments of the English school of painting. Some years after he had quitted the Academy studio, even as late as 1816, the influence of his preceptor was traceable in the mannerism of his works. Though he had by this time made great progress in his art, his career was still one of almost continual failure, hardly cheered by even a passing ray of success. In 1811, after repeated rejections, he had the satisfaction of seeing his "Telemachus rescuing Antiope" on the walls of the Academy. It was badly hung, however, and attracted little notice. For the next five years he persevered with the same indomitable energy in attempting the development of his early training with yearly growing success, and he was even beginning to establish something like a name for himself in 1815 when he resolved to improve his knowledge of art by a journey to Italy. After an absence of three months, however, he was compelled to return home without having penetrated farther south than Florence. Struggles and vexations still continued to harass him, but he bore up against them with patient endurance and force of will. In 1820 his "Coral-findings," exhibited at the Royal Academy, attracted much attention, and its success was more than equalled by that of "Cleopatra's arrival in Calicis," shown in the following year. In 1829 he again set out on a tour to Italy, taking Paris on his way, and astonishing his fellow-students at the Louvre by the rapidity and fidelity with which he copied from the old masters in that gallery. On arriving at Rome he immediately resumed his studies of the old masters, and elicited many expressions of wonder from his Italian fellow-artists for the same qualities which had gained the admiration of the French. Though Etty was duly impressed by the grand chefs-d'oeuvre of Raphael and Michelangelo at Rome, he was not sorry to exchange that city for Venice, which he always regarded as the true home of art in Italy. His own style as a colourist held much more of the Venetian than of any other Italian school, and he admired his prototypes with a zeal and exclusiveness that sometimes bordered on extravagance. He returned home, i.e. semi, however, and had the happiness of seeing his works unjutly withheld were awaiting him. In that year he was made an associate of the Royal Academy, and in 1828 he was promoted to the full dignity of an Academician. In the interval between these dates he had produced the "Combat (Woman interceding for the Vanquished)," and the first of the series of three pictures on the subject of Judith, both of which ultimately came into the possession of the Scottish Academy. Etty's career was from this time one of slow but uninterrupted success. In 1830 he again crossed the channel with the view to another art tour through the continent; but he was orphaned in Paris by the insurrection of the Three Days, and was so much shocked by the sights he was compelled to witness in that time that he returned home with all convenient speed. During the next ten years of his life the zeal and unabated assiduity of his studies were not at all diminished. He was a constant attendant at the Academy Life School, where he used to work regularly along with the students, crossing the same years as his fellow-academicians, who thought the practice undignified. The course of his studies was only interrupted by occasional visits to his native city, and to Scotland, where he was welcomed with the utmost enthusiasm, and fitted with the most gratifying heartiness by his brother-artists at Edinburgh. On the occasion of one of these visits he gave the finishing touches to his trio of Judiths. In 1840, and again in 1841, Etty undertook a pilgrimage to the Netherlands, to seek and examine for himself the masterpieces of Rubens in the churches and public galleries there. Two years later he once more visited France with a view to collecting materials for what he called "his last epic," his famous picture of "Joan of Arc." This subject, which would have tasked to the full even his great powers in the prime and vigour of manhood, proved almost too serious an undertaking for him in his old age. It exhibits, at least, amid great excellences, undeniable proofs of decay on the part of the painter; yet it brought a higher price than any of his earlier and more perfect works, £2500. In 1849, after completing this work, he retired to York, having realized a comfortable independence. One wish alone remained for him now to gratify; he desired to see a "gathering" of his pictures. With this view he visited during the summer of 1848 the great majority of them from various parts of the British Islands; and so numerous were they that the walls of the large hall he engaged in London for their exhibition were nearly covered. This took place in the summer of 1849; on the 13th of November of that same year he died. He received the honours of a public funeral in his native city. Etty holds a secure place among English artists. His drawing was frequently incorrect, but in feeling and skill as a colourist he had few equals. His most conspicuous defects as a painter were the result of insufficient general culture and narrowness of sympathy. See Etty's autobiography, published in the Art Journal for 1849; and the Life of William Etty, R.A., by Gilchrist (2 vols., 1855). ETYMOLOGY (Gr. ἔρυμος, true, and ἄρος, account), that part or branch of the science of linguistics which deals with the origin or derivation of words. The Greek word ἔρυμος, in so far as it was applied to words, referred to the real underlying meaning rather than to the origin. It was the Stoics who asserted that the discovery of Ὀ ἔρυμος would explain the essence of the things and ideas represented by words. Plato in the Cratylus makes a nearer approach to the modern view when he connects, e.g. γυνή, woman, with γυνος, seed, while he jests at such etymological fables as the derivation of ὀρφανός, heaven, ὀψ ὀφρήν ἁπλής, from looking at things above, or ἀνθρώπος, man, from ἀ νά προς ἄ νθρωπος, he who looks up at what he sees. Until the comparative study of philology and the development of the laws underlying phonetic changes, the derivation of words was a matter mostly of guess-work, sometimes right but more often wrong, based on superficial resemblances of form and the like. This popular etymology, to which the Germans have given the name Volks-etymologie or folk-etymology, has had much influence in the form which words take (e.g. "crawfish" or "crayfish," from the French crevet, modern écervise, or "sand-blind," from the Latin oculi, or"Velvet," from the Latin vellus, or "irregular verbs" in Latin, are commonly to be considered as primary, other related forms being taken from them. (7) The whole of a word, and not a portion only, ought to be reasonably accounted for; and, in tracing changes of form, any infringement of phonetic laws is to be regarded with suspicion. (8) More resemblances of form and apparent connexion in sense between languages which have different phonetic laws or no necessary connexion are commonly a delusion, and
are not to be regarded. (g) When words in two different languages are more nearly alike than the ordinary phonetic laws would allow, there is a strong probability that one language has borrowed the word from the other. Truly cognate words ought not to be too much alike. (10) It is useless to offer an explanation of an English word which will not also explain all the cognate forms.

(11) Introduction to Etymological Dictionary of the English Language, 1898.

An English word is either "the extant formal representative or direct phonetic descendant of an earlier (Teutonic) word, or it has been adapted or adopted from some foreign language," adoption being a popular, and adaptation being a literary or learned process; finally, there is formation, i.e. the combination of existing words (foreign or native) or parts of words with each other or with living formants, i.e. syllables which no longer exist as separate words, but yet have an appreciable signification which they impart to the new product. "(see Introduction to the Oxford New English Dictionary, p. xx.

A further classification of words according to their origin is that into (1) naturals, i.e. purely native words, like "mother," "father," "house"; (2) those which become perfectly naturalized, though of foreign origin, like "cat," "mutton," "beef"; (3) denizens, words native in language but kept in disuse and still considered by foreign pronunciation, spelling and inflections, e.g. "focus," "camera"; (4) aliens, words for foreign things, institutions, offices, &c., for which there is no English equivalent, e.g. menu, table d'hôte, impé, laksi, molli, kurbusi; (5) casuals, e.g. bloc, Ausgleich, sabotage, differing only from "aliens" in their temporary use. The full etymology of a word should include the phonetic descent, the source of the word, whether from a native or from a foreign origin, and, if the latter, whether by adoption or adaptation, or, if a formed word, the origin of the parts which go to make it up. In the present edition of the Encyclopædia Britannica such full etymologies, which would be necessary and in place in an etymological dictionary, have not been given in every instance, but brief etymological notes are appended, showing in outline the sources and history, and in many cases the development in meaning. (See also DICTIONARY.)

EU, a town of north-western France, in the department of Seine-Inferieure, on the river Bresle, 64 m. N.E. of Rouen on the Western railway, and 2 m. E.S.E. of Le Tréport, at the mouth of the Bresle, which is canalized between the two towns. Pop. (1906) 4865. The extensive forest of EU lies to the southeast of the town. EU has three buildings of importance—the beautiful Gothic church of St Laurent (12th and 13th centuries) of which the exterior of the choir with its three tiers of ornamented buttressing and the double arches between the pillars of the nave are architecturally notable; the chapel of the Jesuit College (built about 1625), in which are the tombs of Henry, third duke of Guise, and his wife, Katherine of Cleves; and the château. The latter was begun by Henry of Guise in 1578, in place of an older château burnt by Louis XI. in 1475 to prevent its capture by the English. It was continued by Mademoiselle de Montpensier in the latter half of the 17th century, and restored by Louis Philippe who, in 1843 and 1845, received Queen Victoria within its walls. In 1902 the town has a tribunal of commerce and a communal college, flour-mills, manufactories of earthenware, biscuits, furniture, casks, and glass and brick works; the port has trade in grain, timber, hemp, flax, &c.

EU (Augusta) was in existence under the Romans. The first line of its counts, supposed to be descended from the dukes of Normandy, had as heiress Aliz (died 1227), who married Raoul (Raolph) de Lusignan, known as the Sire d’Issoudun from his lodging. Through the N. of France, the N. of Poitou, the N. of the Loire, the S. of Poitou, the N. of Artois, and the countship of EU passed by marriage to the house of Brienne, two members of which, both named Raoul, were constables of France. King John confiscated the countship in 1350, and gave it to John of Artois (1352). His great-grandson, Charles, son of Philip of Artois, count of EU, and Marie of Berry, played a conspicuous part in the Hundred Years’ War. He was taken prisoner at the battle of Agincourt (1415), and remained in England twenty-three years, in accordance with the dying injunctions of Henry V. that he was hot to be let go until his son, Henry VI., was of age to govern his dominions. He accompanied Charles VII. on his campaigns in Normandy and Guyenne, and was made lieutenant-general of these two states. It was at this period of reconciliation between the king and the dauphin after the revolt of 1453 that Louis created a peer of France in 1458, and made governor of Paris during the war of the League of the Public Weal (1456). He died on the 15th of July 1472 at the age of about seventy-eight, leaving no children. His sister’s son, John of Burgundy, count of Nevers, now received the countship, which passed through heiresses, in the 15th century, to the house of Cleves, and to that of Lorraine-Guise. In 1660 Henry II. of Lorraine, duke of Guise, sold it to “Madeemoiselle,” Anne Marie Louise d’Orléans, duchesse de Montpensier (q.v.), who made it over (1683) to the duke of Maine, bastard son of Louis XIV., as part of the price of the release of her lover Lauzun. The second son of the Duke of Maine, Louis Charles de Bourbon (1701-1775), bore the title of count of EU. In 1755 he inherited from his elder brother, Louis Auguste de Bourbon (1700-1753), prince de Dombes, great estates, part of which he sold to the king. The remainder, consisting of his duchy of Guise, was passed to his son, Louis Léopold, comte de Montpensier, and then to his grandson, Louis Jean de Bourbon, count de Penthièvre. These estates were confiscated at the Revolution; but at the Restoration they were bestowed by Louis XVII. on the duchesse-dowager of Orléans who, in 1821, bequeathed them to her son, afterwards King Louis Philippe. They were again confiscated in 1852, but were restored to the Orleans family by the National Assembly after the Franco-German War. The title of count of EU was revived in the 19th century in favour of the eldest son of the duke of Nemours, second son of King Louis Philippe.

EUROPE (pronounced Evia in the modern language), EURIPIDES, or NEKROPONT, the largest island of the Grecian archipelago. It is separated from the mainland of Greece by the Euboic Sea. In general outline it is long and narrow; it is about 90 m. long, and varies in breadth from 30 m. to 4. Its general direction is from N.W. to S.E., and it is traversed throughout its length by a mountain range, which forms part of the chain that bounds Thessaly on the E., and is continued south of Euboea in the lofty islands of Andros, Tenos and Myconos. The principal peaks of this range are grouped in three knots which divide the island into three portions. Towards the north, opposite the Locrian territory, the highest peaks are Mts. Gaetsades (4436 ft.) and Xeron (3293 ft.). The former was famed in ancient times for its medicinal plants, and at its foot are the celebrated hot springs, near the town of Aedepeus (mod. Livopotamos). The latter is called the Battle of Actium (built about 1625), in which are the tombs of Henry, third duke of Guise, and his wife, Katherine of Cleves; and the château. The latter was begun by Henry of Guise in 1528, in place of an older château burnt by Louis XI. in 1475 to prevent its capture by the English. It was continued by Madeleíne de Montpensier in the latter half of the 17th century, and restored by Louis Philippe who, in 1843 and 1845, received Queen Victoria within its walls. In 1902 the town has a tribunal of commerce and a communal college, flour-mills, manufactories of earthenware, biscuits, furniture, casks, and glass and brick works; the port has trade in grain, timber, hemp, flax, &c.

EU (Augusta) was in existence under the Romans. The first line of its counts, supposed to be descended from the dukes of Normandy, had as heiress Aliz (died 1227), who married Raoul (Raolph) de Lusignan, known as the Sire d’Issoudun from his lodging. Through the N. of France, the N. of Poitou, the N. of the Loire, the S. of Poitou, the N. of Artois, and the countship of EU passed by marriage to the house of Brienne, two members of which, both named Raoul, were constables of France. King John confiscated the countship in 1350, and gave it to John of Artois (1352). His great-grandson, Charles, son of Philip of Artois, count of EU, and Marie of Berry, played a conspicuous part in the Hundred Years’ War. He was taken prisoner at the battle of Agincourt (1415), and remained in
The south-western promontory was named Geraeus, the south-eastern Capeareus; the latter, an exposed point, attracts the storms, which rush between it and the neighbouring cliffs of Andros as through a funnel. The whole of the eastern coast is rocky and desolate, especially the part called Coecurnen, or "the Coecken," so called from the Persians being wrecked. So greatly was this dreaded by sailors that the principal line of traffic from the north of the Aegean to Athens used to pass by Chalcis and the Euboic Sea.

Euboia was believed to have originally formed part of the mainland, and to have been separated from it by an earthquake. This is the less improbable because it lies in the neighbourhood of a line of earthquake movement, and both from Thucydides and from Strabo it is clear that the northern part of the island being shaken at different periods, and the latter writer speaks of a fountain at Chalcis being dried up by a similar cause, and a mud volcano formed in the neighbouring plain. Evidences of volcanic action are also traceable in the legends connected with Heracles at Aedepsus and Ceneaum, which here, as at Lemnos and elsewhere in Greece, have that origin. Its northern extremity is separated from the Thessalian coast by a strait, which at one point is not more than a mile and a half in width. In the neighbourhood of Chalcis, both to the north and the south, the bays are so confined as readily to explain the story of Agamemnon's fleet having been detained there by contrary winds. At Chalcis itself, where the strait is narrowest, it is called the Eurius, and here it is divided in the middle by a rock, on which formerly a castle stood. The channel towards Boeotia, which is now closed, is spanned by a stone bridge. The other, which is far the deeper of the two, is crossed by an iron swing-bridge, allowing for the passage of vessels. This bridge, which dates from 186, replaced a smaller wooden swing-bridge erected in 1856. The extraordinary changes of tide which take place in this passage have been a subject of wonder from classical times. At one moment the current runs like a river in one direction, and shortly afterwards with equal velocity in the other. Strabo speaks of it as varying seven times in the day, but it is more accurate to say, with Livy, that it is irregular. A bridge was first constructed here in the twenty-first year of the Peloponnesian War, when Euboia revolted from Athens; and thus the Boeotians, whose work it was, contrived to make that country "an island to every one but themselves." The Boeotians by this means secured a powerful weapon of offence against Athens, being able to impede their supplies of gold and corn from Thrace, of timber from Macedonia, and of horses from Thessaly. The name Eurius was corrupted during the middle ages into Evripo and Evripod and in this latter form it passed into Homer, which became altered to Negroponte, referring to the bridge which connected it with the mainland.

The rivers of Euboia are few in number and scanty in volume. In the north-eastern portion the Budoros flows into the Aegean, being formed by two streams which unite their waters in a small plain, and were perhaps the Cureus and Neles concerning which the story was told that sheep drinking the water of the one became white, of the other black. On the north coast, near Histracea, is the Callas; and on the western side the Lelanus, near Chalcis, flowing through the plain of the same name. This plain, which intervenes between Chalcis and Eretria, and was a fruitful source of contention to those cities, is the most considerable of the few and small spaces of level ground in the island, and was fertile in corn. Aristotle, when speaking of the aristocratic character of the horse, as requiring fertile soil for its support, and consequently being associated with wealth, instances its use among the Chalcidians and Eretrians, and in the former of those two states we find a class of nobles called Hippobolae. This rich district was afterwards occupied by Athenian cleruchs. The next largest plain was that of Histracea, and at the present day this and the neighbourhood of the Budoros (Ampel-Aga) are the two best cultivated parts of Euboia, owing to the exertions of foreign colonists. The mountains afford excellent pasturage for sheep and cattle, which were reared in great quantities in ancient times, and seem to have given the island its name; these pastures belonged to the state. The forests are extensive and fine, and are now superintended by government officials, called δασοφόλοι, in spite or with the compliance of whom the timber of the "thick forest" of the Persians was cut, and the merciless way in which it is cut by the proprietors, is said to have been burnt by the shepherds, for the sake of the rich grass that springs up after such conflagrations, and partly owing to the goats, whose bite kills all the young growths. In the mountains were several valuable mines of iron and copper; and from Karystos, at the south of the island, came the green and white marble, the modern Cipollino, which was in great request among the Romans of the imperial period for architectural purposes, and which belonged to the Eretrians. The scenery of Eretria is perhaps the most beautiful in Greece, owing to the varied combinations of rock, wood and water; for from the uplands the sea is almost always in view, either the wide island-studded expanse of the Aegean, or the succession of lakes formed by the Euboic Sea, together with mountains of exquisite outline, while the valleys and maritime plains are clothed with fruit trees or with plane trees of magnificent growth.

On the other hand, no part of Greece is so destitute of interest as Eretria. The only site which has attracted archaeologists is that of Eretria (q.v.), which was excavated by the American School of Athens in 1890–1891.

Like most of the Greek islands, Euboia was originally known under other names, such as Macris and Dolich, from its shape, and Ellopia and Abantis from the tribes inhabiting it. The races by which it was occupied at an early period were different in the three districts, into which, as we have seen, it was naturally divided. In the northern portion we find the Histiaeans and Ellopes, Thessalian races, which probably had passed over from the Paghasean Gulf. In central Euboia were the Curetes and Abantes, who seem to have come from the neighbouring continent by way of the Eurius; of these the Abantes, after being reinforced by Ionians from Attica, rose to great power, and exercised a sort of supremacy over the whole island, so that in Homer the inhabitants generally are called by that name. The southern part was occupied by the Dryopes, part of which tribe, after having been expelled from their original seats in the south of Thessaly by the Doriens, migrated to this island, and established themselves in the three cities of Karystos, Dysitos and Styra. The population of Euboia at the present day is made up of elements not less various, for many of the Greek inhabitants seem to have immigrated, partly from the mainland, and partly from other islands; and besides these, the southern portion of the island was occupied by Albanians, who were transmuted into Euboians, and in the mountain districts nomad Vlach shepherds are found. History.—The history of the island is for the most part that of its two principal cities, Chalcis and Eretria, the latter of which was situated about 15 m. S.E. of the former, and was also on the shore of the Euboic Sea. The neighbourhood of the fertile Lelantian or Lelantine plain, and their proximity to the place of passage to the mainland, were evidently the causes of the choice of which, as well as of their prosperity. Both cities were Ionian settlements from Attica, and their importance in early times is shown by their numerous colonies in Magna Graecia and Sicily, such as Cumae, Rhegium and Naxos, and on the coast of Macedonia, the projecting portion of which, with its three peninsulas, hence obtained the name of Chalcidice. In this way they opened new trade routes to the Greeks, and extended the field of civilization. How great their commerce was is shown by the fact that the Euboic scale of weights and measures was in use at Athens (until Solon, q.v.) and among the Ionic cities generally. They were rival cities, and at first appear to have been equally powerful; one of the earliest of the sea-fights mentioned in Greek history took place between them, and in this we are told that many of the other Greek states took part. It was in consequence of the aid which the people of Miletus lent to the Eretrians on this occasion that Eretria sent five ships to aid the Ionians in their revolt against the Persians (see IONIA); and owing to this, that city was the first place
EUBULIDES—EUCALYPTUS

in Greece proper to be attacked by Datis and Artaphernes in 490 a.c. It was utterly ruined on that occasion, and its inhabitants were transported to Persia. Though it was restored after the battle of Marathon, on a site at a little distance from its original position, it never regained its former eminence, but it was still the second city in the island. From this time its neighbour Chalcis, which, though it suffered from a lack of good water, was, as Strabo says, the natural capital from its commanding the Euphrus, held an undisputed supremacy. Already, however, this city had suffered from the growing power of Athens. In the year 506, when the Chalcidians joined with the Boeotians and the Spartan king Cleomenes in a league against that state, they were totally defeated by the Athenians, who established 4000 Attic settlers (see CLEARCHUS) on their lands, and seem to have reduced the whole island to a condition of dependence. Again, in 446, when Euboea endeavoured to throw off the yoke, it was once more reduced by Pericles, and a new body of settlers was planted at Histiae in the north of the island, after the inhabitants of that town had been expelled. This event is referred to by Aristophanes in the Clouds (212), where the old farmer, on being shown Euboea on the map "lying outstretched in all its length," remarks,— "I know; we laid it prostrate under Pericles." The Athenians fully recognized its importance to them, as supplying them with corn and cattle, as securing their commerce, and as guaranteeing them against piracy, for its proximity to the coast of Attica rendered it extremely dangerous. Xenophon, in his Anabasis iv. p. 191, says: "Clearchus in the De corona speaks of a time when the pirates that made their headquarters so infested the neighbouring sea as to prevent all navigation. But in the 21st year of the Peloponnesian war the island succeeded in regaining its independence. After this we find it taking sides with one or other of the leading states, until, after the battle of Chaeronea, it passed into the hands of Philip II. of Macedon, and finally into those of the Romans. By Philip V. of Macedon Chalcis was called one of the three futilities of Greece, Demetrias on the Gulf of Pagasse, and Corinth being the other two.

In modern history Euboea or Negropont comes once more prominently into notice at the time of the fourth crusade. In the partition of the Eastern empire by the Latins which followed that event the island was divided into three fiefs, the occupants of which ever long found it expedient to place themselves under the protection of the Venetian republic, which then succeeded the Byzantine empire, and became the sovereign power in the country. For more than two centuries and a half during which the Venetians remained in possession, it was one of the most valuable of their dependencies, and the lion of St. Mark may still be seen, both over the sea gate of Chalcis and in other parts of the town. At length in 1479, after a valiant defence, this well-fortified city was wrested from them by Mahommed II., and the whole island fell into the hands of the Turks. One desperate attempt to regain it was made by Francesco Morosini (d. 1604) in 1688, when the city was besieged by land and sea for three months; but owing to the strength of the place, and the disease which thinned their ranks, the assailants were forced to withdraw. At the conclusion of the Greek War of Independence, in 1830, the island was delivered from the Turkish sway, and constituted a part of the newly established Greek state. Euboea at the present time produces a large amount of grain, and its mineral wealth is also considerable, great quantities of magnesite and lignite being exported. In 1890 it was constituted a separate nome (pop. 1907, 176,903).

EUBULIDES, a native of Miletus, Greek philosopher and successor of Leucippus, as head of the Megarian school. Nothing is known of the events of his life. Indirect evidence suggests he was a contemporary of Aristotle, whom he attacked with great bitterness. There was also a tradition that Demosthenes was one of his pupils. His name has been preserved chiefly by some celebrated, though false and capacious, syllogisms of which he was the reputed author. Though mainly examples of verbal quibbling, they serve to show the difficulties of language and of explaining the relations of sense-given impressions. Eubulides wrote a treatise on Diogenes the Cynic and also a number of comedies. (See MEGARIAN SCHOOL OF PHILOSOPHY.)

EUBULUS, of Anaphylatus, Athenian demagogue during the time of Demosthenes. He was a persistent opponent of that statesman, and was chiefly instrumental in securing the acquittal of Aeschines (who had been his own clerk) and Accius’s guilt, in connexion with the embassy to Philip of Macedon. Eubulus took little interest in military affairs, and was (at any rate at first) a strong advocate of peace at any price. He devoted himself to matters of administration, especially in the department of finance, and although he is said to have increased the revenues and to have done real service to his country, there is no doubt that he took advantage of his position to make use of the material forces of the state for his own aggrandizement. His proposal that any one who should move that the Theoric Fund should be applied to military purposes should be put to death may have gained him the goodwill of the people, but it was not in the true interest of the state. Later, Eubulus himself seems to have recognized this, and to have been desirous of modifying or repealing the regulation, but it was too late; Athens had lost all feelings of patriotism; cowardly and indolent, she rivalled even Tarentum in her luxury and extravagance (Theopompus and Ctesias). The Eubulean laws were abolished by Lysimachus, and Eubulus himself was banished from Athens. Shortly after the death of Lysimachus, Eubulus was recalled to Athens, and was appointed one of the members of an embassy to Philip. Eubulus allowed himself to be won over, and henceforth did his utmost to promote the cause of the Macedonian. The indignant remonstrances of Demosthenes failed to weaken Eubulus’s hold on the popular favour, and after his death (before 330) he was distinguished with special honours, which were described by Hypereides in a speech (Πρώτοι ἔργοι Ἐυβολίων βασιλιάς) now lost. Eubulus was no doubt a man of considerable talent and reputation as an orator, but none of his speeches has survived, nor is there any appreciation of them in ancient writers. Aristotle (Rhetoric, i. 15. 15) mentions a speech against Chares, and Theopompos (in his Philipica) had given an account of his life, extracts from which are preserved in Harpocrates.

EUCALYPTUS, an Australian genus of trees of the natural order Myrtaceae, indigenous, with a few exceptions, to Australia and Tasmania. In Australia the Eucalypti are commonly called "gum-trees" or "stringy-bark trees," from their gummy or resinous products, or fibrous bark. The genus, from the evidence of leaf-remains, appears to have been represented by several species in Eocene times. The leaves are leathery in texture, hang obliquely or vertically, and are studded with glands which contain a fragrant volatile oil. The petals cohere to form a cap which is discarding when the flower expands. The fruit is surrounded by a woody cup-shaped receptacle and contains very numerous minute seeds. The Eucalypti are rapid in growth, and many species are of great height, E. amygdalina, the tallest known tree, attaining to as much as 480 ft., exceeding in height the Californian big-tree (Sequoia gigantea), with a diameter of 81 ft. E. globulus, so called from the rounded form of its capitate corolla, is the bluest of the eucalyptus, and the most considerable. The leaves of trees from three to five years of age are large, sessile and of a glaucous-white colour, and grow horizontally; 1

1 Whence the name (εὐκαλύπτης, well-covered) given by L’Heritier, 1788.
On destructive distillation the leaves yield much gas, 10,000 cub. ft. being obtained from one ton. The wood is extensively used in Australia as fuel, and the timber is of remarkable size, strength and durability. Maiden enumerates nearly 70 species as timber-yielding trees including E. amygdalina, the wood of which splits with remarkable facility, E. booyioides, hard, tough, durable and resistant to fire; E. divericolor or "karii," E. globulus, E. leucocoryton or ironbark, E. marginata or "jarrah" (see Jarrah Wood), E. obliqua, E. resinifera, E. siderophloia and others. The timber is often very hard, tough and durable, and useful for shipbuilding, building, fencing, planks, &c. The bark of different species of Eucalyptus has been used in paper-making and tanning, and in medicine as a febrifuge.

For further details see Baron von Müller's monograph of the genus, Eucalyptographia (Melbourne, 1879-1884).

**EUCHARIS**, in botany, a genus of the natural order Amarilidaceae, containing a few species, natives of Columbia. *Eucharis amazonica* or grandiflora is the best-known and most generally cultivated species. It is a bushy plant with broad-stalked leaves, and an erect scape 1½ to 2 ft. long, bearing an aggregated head, the calyx 3 to 3½ cm. long, with white showy flowers. The flowers resemble the daffodil in having a prominent central cup or corona, which is sometimes tinged with green. It is propagated by removing the offsets, which may be divided in spring, potting them singly in 6-in. pots. It requires good loamy soil, with sand enough to keep the compost open, and should have a good supply of water and a temperature of 65°F to 70°F during the night, with a rise of 8°F to 10°F in the day. During summer growth it is encouraged by repotting, but the plants should afterwards be slightly rested by removing to a night temperature of about 60°F, water being withheld for a time, though they must not go too long dry, the plant being an evergreen. By the turn of the year they may again have more heat and more water, and this will probably induce them to flower. After this they are often shifted and grown again as before; and, as they get larger, either be divided to form new plants or allowed to develop into nobler specimens. With a stock of the smaller plants to start them in succession, they may be had in flower all the year round. A few years ago the bulbs of *E. amazonica* were badly infected with a disease known as the Eucharis mite, and all kinds of remedies were tried without avail, although steeping in Condyl's fluid appeared to give the best results. The disease appears to have died out again. Other species of Eucharis now met with in gardens are E. Bakeriana, E. Mastersii, E. Lowi and E. Sanderi. A remarkable hybrid was raised a few years ago between *Eucharis and Eucrosia*, and has been named *Eucrosia*, to which the compound name *Euroecharina* was given.

**EUCHARIST** (Gr. εὐχαριστία, thanksgiving), in the Christian Church, one of the ancient names of the sacrament of the Lord's Supper or Holy Communion. The term εὐχαριστία was at first applied to the act of thanksgiving associated with the sacrament; later, so early as the 2nd century, to the objects, e.g. the sacramental bread and wine, for which thanks were given; and so to the whole celebration. The term Mass, which has the same connotation, is derived from the Latin *missa* or *missio*, because the children and catechumens, or unbaptized believers, were dismissed before the eucharistic rite began. Other names express various aspects of the rite: Communion (Gr. κομμωμα), the fellowship between believers and union with Christ; Lord's Supper, so called from the manner of its institution; Sacrament as a consecration of material elements; the Mystery (in Eastern churches) celebration; and in the Latin liturgy, the Sacrifice, as a rehearsal of Christ's passion. In this article the history of the rite is first traced up to A.D. 200 in documents taken in their chronological order; differences of early and later usage are then discussed; lastly, the meaning of the original rite is examined.

St Paul (1 Cor. xi. 17-34) attests that the faithful met regularly in church, i.e. in religious meetings, to eat the dominical or Lord's Supper, but that this aim was frustrated by some who ate up their provisions before others, so that the poor were left hungry...
while the rich got drunk; and the meetings were animsted less by a spirit of brotherhood and charity than of division and faction. He directs that, when they so meet, they shall wait for one another. Those who are too hungry to wait shall eat at home; and not put to shame those who have no houses (and presumably not enough food either), by bringing their viands to church and selfishly eating them apart.

It was therefore not the quantity or quality of the food eaten that constituted the meal a Lord’s Supper; nor even the circumstances that they ate it “in church,” as was assumed by those guilty of the practices here condemned; but only the pervading sense of brotherhood and love. The contrast lay between the Dominical Supper or food and drink shared unselingly by all with all, and the private supper, the feast of Dives, shamelessly gorged under the eyes of timid and shrinking Lazarus. By way of enforcing this point Paul repeats the tradition he had received direct from the Lord, and already handed on to the Corinthians, of how the Lord Jesus on the night in which he was betrayed “(not necessarily the night of Passover)” took bread and having given thanks brake it and said, This is my body, which is for your sake; this do in remembrance of me. In like manner also the cup, after supper, saying, This cup is the new covenant through my blood: this do, as oft as ye drink it, in remembrance of me.” Paul adds that this rite commemorated the Lord’s death and was to be continued until he should come again, as in that age they expected him to do after no long interval: “As often as ye eat this bread and drink the cup, ye do (or ye shall) perform the Lord’s death till he come.”

The same epistle (x. 17) attests that one loaf only was broken and distributed: “We who are many, are one loaf (or bread), one body; for we all partake of the one loaf (or bread).” As a single loaf could not satisfy the hunger of many, the reheartals in these meals of Christ’s own action must have been a crowning episode, enhancing their sanctity. The Fructo Panis probably began, as the drinking of the cup certainly ended, the supper; the interval being occupied with the common consumption by the faithful of the provisions they brought. This much is implied by the words “after supper.” If, in any case, all present had eaten in their homes beforehand, the giving of the cup would immediately follow on the breaking and eating of the one loaf, but Paul’s words indicate that the common meal within the church was the norm. Those who ate at home marked themselves out as both greedy and lacking in charity. There is no demand that they should come fasting. Paul would not introduce, as St. Paul (v. 54) that those who were too hungry to wait until all the brethren were assembled in church, should eat at home and beforehand.

Mark xiv. 22–25, Matt. xxvi. 26–29, Luke xxii. 14–30, are, in order of time, our next accounts, Mark representing the oldest tradition. They all in substance repeat Paul’s account, but identify the night on which Jesus was betrayed with that of the Pascha. In Matthew and Mark, Jesus says of the bread “Take ye it, this is my body,” omitting the idea of sacrifice imported by Paul’s addition “which is for you”; but in them Jesus enunciates the same idea when he says of the cup: “This is my blood of the covenant which is poured out for many,” Mathew adding “for the remission of sins,” a phrase which savours of Heb. ix. 22: “apart from the shedding of blood there is no remission.” It is a later addition, and so may be the words “which is poured out for many.” But the words which follow have an antique ring: “Amem, I say unto you, I will no more drink of the fruit of the vine, until that day when I drink it new in the kingdom of God.” For here Jesus affirms his conviction, in view of his impending death, which, unlike his disciples he foresaw, that, when the kingdom of God is instituted on earth, he will take his place in it. But this is the last time he will sit down upon earth with his disciples at the table of the millennial tape. These sources do not hint that the Last Supper is to be repeated by Christ’s followers until the advent of the kingdom. Luke’s account is too much interpolated from Paul, and the texts of his oldest MSS. too discrepant, for us to rely on it except so far as it supports the other gospels. It emphasizes the fact that the Last Supper was the Pascha. “With desire have I desired to eat this Passover, before I suffer”; and places the bread after the wine, unless indeed the Pauline interpolation comprises the whole of verse 10.

The fourth gospel, written perhaps A.D. 90–100, sublimates the rite, in harmony with its general treatment of the life of Jesus: “I am the living bread which cometh down out of heaven, that a man may eat thereof and not die” (John vi. 51). As in 1 Cor. x. the flesh of Christ is contrasted with the manna which saved not the Jews from death, so here the latter ask: “How can this man give us his flesh to eat?” and Jesus answers: “Amen, Amen I say unto you, Except ye eat the flesh of the Son of Man and drink his blood, ye have not life in yourselves. . . . He that eateth my flesh and drinketh my blood abideth in me and I in him.” In an earlier passage, again in reference to the manna, Jesus is called “the bread of God, which cometh down out of heaven, and giveth life unto the world.” They ask: “Lord, ever more give us this bread,” and he answers: “I am the bread of life: he that cometh to me shall not hunger, and he that believeth on me shall never thirst.” This writer’s thought is coloured by the older speculations of Philo, who in metaphor called the Logos the heavenly bread and food, the cupbearer and cup of God; and he seems even to protest against a literal interpretation of the words of institution, since he not only pointedly omits them in his account of the Last Supper, but in v. 63 of this chapter writes: “It is the Spirit that quickeneth; the flesh profiteth nothing; the words that I have spoken unto you are spirit and life.”

In Acts ii, 46 we read that, “the faithful continued steadfastly with one accord in the temple”; at the same time “breaking bread at home they partook of food with gladness and singleness of heart, praising God.” All such repasts must have been sacred, but we do not know if they included the Eucharistic rite. The care taken in the selecting and ordaining of the seven deacons argues a religious character for the common meals, which they were to serve. Their main duty was to look after the duty of the Hellenistic widows, but inasmuch as meats strangled or consecrated to idols were forbidden, it probably devolved on the deacons to take care that such were not introduced at these common meals. The Essenes, similarly, appointed houses all over Palestine where they could safely eat, and priests of their own to prepare their food. Some Christians escaped the difficulties of their position by eating no meat at all. “He that is weak” says Paul (Rom. xiv. 21) “eateth herbs;” that is, becomes a vegetarian. Rather than scandalize weaker brethren, Paul was willing to eat herbs the rest of his life.

The travel-document in Acts often refers to the solemn breaking of bread. Thus Paul in xxvii. 35, having invited the ship’s company of 276 persons to partake of food, took bread, gave thanks to God in the presence of all, and brake it and began to eat. The rest on board then began to be of good cheer, and themselves also took food. Here it is not implied that Paul shared his food except with his co-believers, but he ate before them all. Whether he repeated the words of institution we cannot say.

In Acts xx. 7 the faithful of Troas gather together to break bread “on the first day of the week” after sunset. After a discourse Paul, who was leaving them the next morning, broke bread and ate. This was surely such a meeting as we read of in 1 Cor. x., and was held on Sunday by night, but long before dawn, since after it Paul “talked with them a long while, even till break of day.” In 1 Cor. xvi. 1 Paul bids the Corinthians, as he had bidden the churches of Galatia, lay up in store on the first of the week, each one of them, money for the poor saints of Jerusalem. This is the first notice of Sunday Eucharistic collections of alms for the poor.

Here seems to belong in the order of development the Cathar Eucharist (see CATHARI). The Cathari would only the Lord’s prayer in consecrating the bread and used water for wine.

The next document in chronological order is the so-called Teaching of the Apostles (A.D. 90–110). This assigns prayers and rubrics for the celebration of the Eucharist:
Eucharist

Supper to be eaten, whenever he is warmed by the Spirit to do so. But he must not himself partake of it—a very practical rule. The prophets are to give thanks as they like at these "breakings of bread," without any restrictions to the prayers here set forth. In 2x. 3 the overseers or bishops and deacons, though their functions are less spiritual than administrative and economic, are allowed to take the place of the prophets and teachers. The phrase used is λατρεύοντες τῷ λατρευτικῷ, "to liturgize the liturgy." This word "liturgy" soon came to connote the Eucharist. The prophets who normally preside over the Suppers are called "your high-priests," and receive from the faithful the first-fruits of the winepress and threshing-floor. They then open and receive each bread and each cup of wine, and of oil. Out of these they provide the Suppers held every Lord's day, offering them as a "pure sacrifice." Bishops and deacons hold a subordinate place in this document; but the contemporary Epistle of Clement of Rome attests that these bishops "had offered the gifts without blame and holly." The word "liturgy" is also used by Clement.

Pliny’s Letter (Epist. 96), written a.d. 112 to the emperor Trajan, about the Christians of Bithynia, attests on a fixed day, stato die (no doubt Sunday), they met before dawn and recited antiphonally a hymn "to Christ as to a god." They then separated, but met again later to partake of a meal, which, however, was of an ordinary and innocent character. Pliny regarded their meal as identical in character with the common meals of hetairia, i.e. the trade-gilds or secret societies, which were then, as now, often inimical to the government. Even before, these societies were forbidden by the Roman autocrats, and the "dominical suppressors" of the Christians were not likely to be spared. Pliny accordingly forbade them in Bithynia, and the renegade Christians to whom he owed his information gave them up. These suppressors included an Eucharist; for it was because the faithful ate in the latter of the flesh and blood of the Son of God that the charge of devoutly children was made against them. If, then, this afternoon meal did not include it, Pliny’s remark that their food was ordinary and innocent is unintelligible.

Ignatius, about a.d. 130, in his letter to the Ephesians, defines the one bread broken in the Eucharist as a "drug of immortality, and antidote that we should not die, but live for ever in Jesus Christ." He also rejects as invalid any Eucharist not held "under the bishop or one to whom he shall have committed it." For the Christian prophet has disappeared, and with him the custom of holding Eucharists in private dwellings.

In Justin’s Epistle to the Philonicians, in memory to Justin Martyr, we read (p. 7) that "Christians have in vogue among themselves a table common, yet not common" (i.e. unclean). In Justin’s first apology (c. 140) we have two detailed accounts of the Eucharist, of which the first, in ch. 65, describes the first communion of the newly baptized:

"After we have thus washed the person who has believed and conformed we lead him to the brethren, so called, where they are gathered together, to offer public prayer both for ourselves and for the person illuminated, and for all others everywhere, earnestly, to the end that having learned the truth we may be made worthy to be found not only in our actions good citizen, but guardians of the things enjoined."

We salute one another with a kiss at the end of the prayers. Then there is presented to the presider of the bread and a cup of water (and of a mixture), and he having taken it sends up praise and glory to the father of all things by the name of the Son and Holy Spirit, and he offers at length thanksgiving (eucharistia) for having been made worthy of these things by him. But when he concludes the prayer and thanksgiving all the people present answer with acclamation 'Amen.' But the word ‘Amen’ in Hebrew signifies ‘for it.’ And when the words of the Lord are ended, the people have so answered, those who are called by us deacons distribute to each of those present, for them to partake of the bread and wine, which they have been given, and they carry portions away to those who are not present. And this food is called by us Eucharistia, and of it none may partake save those who believe our teaching to be true and have washed in the bath which is for remission of sin and rebirth, and who live as

5 Matt. vii. 6.
6 Matt. xix. 22.
7 We should probably omit the words bracketed.
8 The codex Othoebonius omits the words bracketed.
Christ taught. For we do not receive these things as common bread or common drink. For as Jesus Christ our Saviour was made flesh by Word of God and possessed flesh and blood for our sake; so we have been taught that the food blessed (lit. thanked for) by prayer of Word spoken by him, food by which our blood and flesh are by change of it (into them) nourished, is both flesh and blood of Jesus so made flesh. For the apostles in the memorials made by them, which are called gospels, have so related it to have been eaten on them: to wit, that Jesus took bread, gave thanks and said: This do ye in memory of me, this is my body, and the cup likewise he looked and gave thanks and said, This is my blood; and he distributed them alone. And this rite too the evil demons by way of imitation handed down in the mysteries of Mithras. For that bread and a cup of water is presented in the rites of their initiation with certain conclusions (or epilogues), you either know or can learn.

The second account, in ch. 67, adds that the faithful both of town and country met for the rite on Sunday, that the prophets were read as well as the gospels, that the president after the reading delivered an exhortation to imitate in their lives the goodly narratives; and that each brought offerings to the president out of which he added orphans and widows, and also the prisoners and strangers sojourning with them. These contributions of the faithful seem to be included by Justin along with the bread and cup as sacrifices acceptable to God. But he also particularly specifies (Dialog. 345) that perfect and pleasing sacrifices alone consist in prayers and thanksgivings (θυσίας). The elements are gifts or offerings. Justin was a Roman, but may not represent the official Roman church. The rite as he pictures it agrees well with the developed liturgies of a later age.

Irenæus (Gaul and Asia Minor, before 190) in his work against heresies, iv. 31. 4, points to the sacrament in proof that the human body may become incorruptible:

"As bread from the earth on receiving unto itself the invocation of God is no longer common bread, but is an Eucharist, composed of two elements, an earthly and a heavenly, so our bodies by partaking of the Eucharist cease to be corruptible, and possess the hope of eternal resurrection."

There is a similar passage in the 36th fragment (ed. Harvey ii, p. 500), sketching the rite and calling the elements antitypes:

"The oblation of the Eucharist is not fleshly, but spiritual and so pure. For we offer to God the bread and the cup of blessing (ὁληντής), thanking him for that he made the earth produce these fruits for our sustenance. And therewith having sprinkled (ἐκπολέμω), we invoke the Holy Spirit to constitute this offering, both the bread body of Christ and the cup the blood of Christ, that those who partake of these antitypes (Ἀρτοῦς, Ἐκπόλεμος) may receive the life and eternal life.

Here we note the stress laid on the Invocation of the Spirit to operate the transformation of the elements, though in what sense they are transformed is not defined. This ἐπικλησία survives in the Greek liturgies, but in the Roman a prayer takes its place that the angel of the Lord may take the oblation laid on the visible altar, and carry it up to the altar sublime into the presence of the divine majesty. We must not forget that the church of Irenæus was Greek.

To the second century, lastly, belongs in part the evidence of the catacombs, on the walls of which are depicted persons reclining at tables supporting a fish, accompanied by one or more baskets of loaves, and more rarely by flasks of wine or water. The fish represents Christ; and in the Inscription of Abercius, bishop of Hierapolis about A.D. 200, we have this symbolism enshrined in a literary form: "In company with Paul I followed, while everywhere Faith led the way, and set before me the fish from the fountain, mighty and stainless, whom a pure virgin grasped, and gave this to friends to eat always, having good wine and giving the mixt cup with bread." This representation of baskets of loaves and several fishes, or of one fish and several loaves, seems to contradict the usage of one loaf. It may represent the ἀγόρι of Lord's Supper as a whole, of which the one loaf and cup formed an episode. Or the entire story of bread and fish is a memorial of Jesus in virtue of the initial consecration of one single loaf.

To the second century also belong two gnostic uses. Firstly, that of Marcus, a Valentinian, of South Gaul about 150, whose influence extended to Asia Minor. Irenæus relates (Bk. I., ch. vii.

that this "magician" used in the Eucharist cups apparently mix with wine, but really containing water; and during long invocations made them appear "purple and red, as if the universal Grace had dropped some of her blood into the cup through his invocation, and by way of inspiring worshippers with a passion to taste the cup and drink deep of the influence termed Charis." Such a rite presupposes a belief in a real change of the elements; and water must have been used. In the sequel Irenæus recites the Invocation read by Marcus before the communicants: -- that it is before all things, that passeth understanding and words, replenish thy inner man, and make to abound in thee the knowledge of her, sowing in the good soil the grain of mustard seed."

The Acts of Thomas, secondly, ch. 46, attest an Eucharistic usage, somewhat apart from the orthodoxion. The apostle spreads a linen cloth on a bench, lays on it bread of blessing (ὁληντής), and says:

"Jesus Christ, Son of God, who hast made us worthy to commune in the Eucharist of thy holy body and precious blood, Lo, we venture on the thanksgiving (Eucharistia) and invocation of thy blessed name, come now and communicate with us. And he began to speak and said: Come, let us raise our hands: and the Lord, who knoweth the mysteries of the Elect one, and the secret of his communication with the Father, and the mystery of which we perform in thy name and in the love (agape) in which we are met at thy calling. And having said this he made a cross upon the bread, and brake it and began to distribute it. And first to the woman he gave a piece, and to the man another. This shall be a token of sins and release of eternal transgressions. And after he gave also to all the rest that had received the seal."

In the 2nd century the writer who nearest approaches to the later idea of Transubstantiation is the gnostic Theodotus (c. 160):

"The bread no less than the oil is hollowed by the name of the name. They remain the same in outward appearance as they were received, but by that power they are transformed into a spiritual power. So the water when it is exercised and becomes spiritual, not only drives out the evil principle, but also contracts a power of hollowing."

In the Fathers of the first three or four centuries can be traced the same tendency to spiritualize the Eucharist as we encountered in the fourth gospel, and in the Didache. Ignatius, though in Smyrn. 7 he asserts the Eucharist to be Christ's flesh which suffered for our sins, elsewhere speaks of the blood as being "joy eternal and lasting," as "hope," as "love incorruptible," and of the flesh as "faith" or as "the gospel." Clement of Alexandria (c. 180) regards the rite as an initiation in divine knowledge and immortality. The only food he recognizes is spiritual; e.g. knowledge of the divine Essence is "eating and drinking of the divine Word." So Origen declares the bread which God the Word asserted was his body to be that which nourished souls, the word from God the Word proceeding, the bread from the heavenly Father. Not the visible bread held in his hand, nor the visible cup, were Christ's body and blood, but the word in the mystery of which the bread was to be broken and the wine to be poured out. "We drink Christ's blood," he says elsewhere, "when we receive His words in which standeth Life." So the author of the Contra Marcilium writes in view of John vi. 63 as follows (De eccl. Theol. p. 180):

"In these words he instructed them to interpret in a spiritual sense, all the words and actions. But I, he said, think that I mean the flesh which invests and covers me, and bid you eat that; nor suppose either that I command you to drink a mixture of wine and sanguine blood. Nay, you know well that my words which I have spoken unto you are spirit and life. It follows that the very words and discourses are his flesh and blood, of which he who constantly partakes is also spiritually nourished and will partake of the heavenly life. Let not then, he says, this scandalize you which I have said about eating of my flesh and about drinking of my blood. Nor let the obvious and first hand meaning of what I said about meat and blood disturb you in the least. For these words avail nothing if heard and understood literally (or sensibly). But it is the spirit which quickens them that can understand and spiritually apprehend them."

But these views were not those of the uninstructed pagans who filled the churches and needed a rite which brought them, as their old sacrifices had done, into physical contact and union with their god. Their point of view was better expressed in the scruples of priests, who, as Tertullian (c. 200) records (De
Corona, iii.), were careful lest a crumb of the bread or a drop of the wine should fall on the ground, and by such incidents the body of Christ be harassed and attacked!

The Eucharist as a Sacrifice.—Before the 3rd century we cannot trace the view that in the Eucharistic rite the death of Christ, regarded from the Pauline standpoint as an atoning or redemptive sacrifice, was commemorated and received, i.e., the germ out of which it would surely grow is already present in the words “My blood . . . which is shed for many” of Matt. and Mark; yet more surely in Paul’s “my body which is in your behalf” and “this do in commemoration of me,” where the Greek word for do, Gr. ἔσοψα, Lat. facie, could to pagan ears mean “this do ye sacrifice.” In the first two centuries the rite is spoken of as an offering and as a bloodless sacrifice; but it is God’s own creations, the bread and wine, alms and first-fruits, which, offered with a pure conscience, he receives as from friends, and bestows in turn on the poor; it is the praise and prayers which are the sacrifice. In these centuries baptism was the rite for the remission of sin, not the Eucharist; it is the prophet in the Didache who presides at the Lord’s Supper, not the Levitically conceived priest; nor as yet has the Table become an Altar. Among Christians, prayers, supplications and thanksgivings have taken the place of the sacrifices of the old covenant.

In Cyprian of Carthage (c. 250) we first find the Eucharist regarded as a sacrifice of Christ’s body and blood offered by the priest for the sins of the living and dead. We cannot drink the blood of Christ unless Christ has been first trodden under foot and pressed. As Jesus our high priest offered himself as a sacrifice to his Father, so the human priest takes Christ’s place, and imitates his action by offering in church a true and full sacrifice to God the Father (Ep. 63). He speaks of the dominical host (hostia), and takes the verb to do in Paul’s letter in the sense of to sacrifice. As early as Tertullian prayers for the dead, who were named, were offered in the rite; but there was as yet no idea of the sacrifice of Christ being reiterated in their behalf. After Cyprian’s day this view gains ground in the West, and almost obscures the older view that the rite is primarily an act of communion with Christ. In harmony with Cyprian’s new conception is another innovation of his age and place, that of children communicating; both were the natural accomplishment of infant baptism, of which we first hear in his letters. In the East we do not hear of the sacrifice of the body and blood before Eusebius, about the year 300. In the Armenian church of the 12th century the idea of a reiterated sacrificial death of Christ still seemed bizarre and barbarous. But as early as 358 in Gaul the bread was arranged on the altar in the form of a man, so that one believer ate his eye, another his ear, a third his hand, and so on, according to their rank and order, as is bidden by Pope Pelagius I; but in the Greek church the custom survives, the priest even stabbing with “the holy spear” in its right side the human figure planned out of the bread, by way of rehearsing in pantomime the narrative of John xix. 34.

The change from a commemoration of the Passion to a re-enacting of it came slowly in the Greek church. Thus Chrysostom (Hom. 17, ad Heb.), after writing “We offer ( ναοθετήτω) not another sacrifice of mankind, but the same,” instantly corrects himself and adds: “rather we perform a re-enactment of the sacrifice.” This was exactly the position also of the Armenian church.

Wine or Water?—Justin Martyr perhaps contemplated the use of water instead of wine, and Tatian his pupil used it. The Marcionites, the Ebionites, or Judaeo-Christians of Palestine, the Montanists of Phrygia, Africa and Galatia, the confessor Alciatiades of Lyons, c. a.d. 277 (Euseb. Hist. Eccl. v. 3. 2), another of his contemporaries, in his Cyprian (Ep. 65) and Simplician (c. 350) that his predecessors on the throne of Carthage had used water, and that many African bishops continued to do so, “out of ignorance,” he says, “and simpedimindedness, and God would forgive them.” Pionius, the Catholic martyr of Smyrna, c. 250, also used water. In the Acts of Thomas it is used. Such uniformity of language has led Prof. Harnack to suppose that in the earliest age water was used equally with wine, and Eusebius the historian, who had means of judging which we have not, saw no difficulty in identifying with the first converts of St Mark the Therapeutes of Philo who took only bread and water in their holy repast.

Abercius and Irenæus are the first to speak of wine mixed with water. Abercius, writing in the 2nd century, speaks of a ὁμορράνα, (Homorrana) (Hist. V. 10), and Thaddæus, the disciple of the East, then as now, no one took wine without so mixing it. Cyprian insists on the admixture of water, which he says represented the humanity of Jesus, as wine his godhead. The users of water were named Aquarii or hydrorastasai in the 4th century, and were liable to death under the code of Theodosius. Some of the Monophysite churches, e.g. the Armenian, eschewed water and used pure wine, so falling under the censure of the council in Trullo of 692. Milk and honey was added at first communions. Oil was sometimes offered, as well as wine, but it would seem for consecration only, and not for consumption along with the sacrament. With the bread, however, was sometimes consecrated cheese, e.g. by the African Montanists in the 2nd century. Bitter herbs also were often added, probably because they were eaten with the Paschal lamb. Many early canons forbade the one and the other. Hot water was mixed with the wine in the Greek churches for some centuries, and this custom is seen in catacomb paintings. It increased the resemblance to real blood.

Position of the Faithful at the Eucharist.—Tertullian, Eusebius, Chrysostom and others represent the faithful as standing at the Eucharist. In the art of the catacombs they sit or recline in the ordinary attitude of banqueters. In the age of Christ standing up at the Paschal meal had been given up, and it became the rule to recline. Kneeling with a view to adoration of the elements was unheard of in the primitive church, and the Armenian Fathers of the 12th century insist that the sacrament was intended by Christ to be eaten and not gazed at (Nerses, op. cit. p. 167). Eucharistic or any other liturgical vestments were unknown until late in the 5th century, when certain bishops were honoured with the same pallium worn by civil officials (see Vestments).

In the Latin and in the Monophysite churches of Armenia and Egypt unleavened bread is used in the Eucharist on the somewhat uncertain ground that the Last Supper was the Paschal meal. The Greek church uses leavened.

Transubstantiation.—In the primitive age no one asked how Christ was present in the Eucharist, or how the elements became his body and blood. The Eucharist formed part of an ἀγάπη or love feast until the end of the 2nd century, and in parts of Christendom continued to be so much later. It was, save where animal sacrifices survived, the Christian sacrifice, par excellence. Then men began to ask themselves what it meant. Rival schools of thought sprang up, and controversy raged over it, as it had aforetime over the homousion, or the two natures. Thus the sacrament which was intended to be a bond of peace, became a chief cause of dissension and bloodshed, and was often discussed as if it were a vulgar talisman.

Serapion of Thmuis in Egypt, a younger contemporary of Athanasius, in his Eucharistic prayers combines the language in the Arian catechism with a language damnable to that document, which now only survived in the form of a grace used at table in the nunneries of Alexandria (see Agapē). He entreats “the Lord of Powers to fill this sacrifice with his Power and Participation,” and calls the elements a “living sacrifice, a bloodless offering.” The bread and wine before consecration are “like-nesses of his body and blood,” this in virtue of the words pronounced over them by Jesus on the night of his betrayal. The
prayer then continues thus: "O God of truth, let thy holy Word settle upon this bread, that the bread may become body of the word, and on this cup, that the cup may become blood of the truth. And cause all who communicate to receive a drug of life for healing of every disease and empowering of all moral advancement and virtue. Here the bread and wine become by consecration temporalized in the body and blood of Christ, and the Word is transformed, as it were, into flesh and dwelled in flesh. They cease to be mere likenesses of the body and blood, and are changed into receptacles of divine power and intimacy, by swallowing which we are benefited in soul and body. Cyril of Jerusalem in his catecheses 5 enunciates the same idea of μεταμορφωσις or transformation. Gregory of Nyssa also about the same date (in Migne, Patrolog. Graecæ, vol. 46, col. 581, oration on the Baptism) asserts a "transformation" or "transubstantiation" (μεταμορφώσεως) of the elements into centres of mystic force; and assimilates their consecration to that of the water of baptism, of the altar, of oil or chrism, of the priest. He compares it also to the change of Moses' rod into a snake, of the Nile into blood, to the virtue inherent in Elijah's mantle or in the wood of the cross or in the clay mix of dust and the Lord's spittle, or in Elisha's relics which raised a corpse to life, or in the burning bush. All these, he says, are forms of matter destined for the life of the world through miracles they became vehicles of the power of God absorbed or taken into themselves." He thus views the consecration of the elements as akin to other consecrations; and, like priestly ordination, as involving "a metamorphosis for the better," a phrase which later on became classical. John of Damascus (c. 750) believed the bread to be mysteriously changed into the Christ's body, just as when eaten it is changed into any human body; and he argued that it is wrong to say, as Irenæus had said, that the elements are mere antitypes after as before consecration. In the West, Augustine, like Eusebius and Theodoret, calls the elements signs or symbols of the body and blood signified in them; yet he argues that Christ "took and lifted up his own body in his hands when he took the bread." At the same time he admits that "no one eats Christ's flesh, unless he has first adored (nisi prius adoraverit). But he qualifies this "Receptionist" position by declaring that Judas received the sacrament, as if the unworthiness of the recipient made no difference.

Out of this mist of contradictions scholastic thought strove to emerge by means of clear-cut definitions. The drawback for the dogmatist of such a view as Serapion broaches in his prayers was this, that although it explained how the Logos comes to be immanent in the elements, as a soul in its body, nevertheless it did not guarantee the presence in the bread and wine of the natural elements of Christ's real body and blood. It only provided an εὐρετήριον or surrogate body. In 830-850, Paschasia Radbert taught that after the priest has uttered the words of institution, nothing remains save the body and blood under the outward form of bread and wine; the substance is changed and the accidents alone remain. The elements are miraculously recreated as body and blood. This view harmonized with the docetic view which lurked in East and West, that the manhood of Jesus was but a likeness or semblance under which the God was concealed. So Marcion argued that Christ's body was not really flesh and blood, or he could not have called it bread and wine. Paschasia shrank from the logical outcome of his view, namely, that Christ's body or part of it is turned into human excrement, but Ratramnus, another monk of Corvey, in a book afterwards ascribed to Duns Scotus, drew this inference in order to discredit his antagonists, and not because he believed it himself. The elements, he said, remain physically what they were, but are spiritually raised as symbols to a higher power. Perhaps we may illustrate his position by saying that the elements undergo a change analogous to what takes place in iron, when by being brought into an electric field it becomes magnetic. The substance of the elements remain as well as their accidents, but like baptismal water they gain by consecration a hidden virtue benefiting soul and body. Ratramnus' view thus resembled Serapion's, after whom the elements furnish a new vehicle of the Spirit's influence, a new body through which the Word operates, a fresh sojourning among us of the Word, though consecrated bread is in itself no more Christ's natural body than are we who assimilate it. Other doctors of the 9th century, e.g. Hincmar of Reims and Haimoof Halberstadt, took the side of Paschasia, and affirmed that the substance of the bread and wine is changed, and that God leaves the colour, taste and other outward properties out of mercy to the worshippers, who would be overcome with dread if the underlying real flesh and blood were nakedly revealed to their gaze. Berengar in the 11th century assailed this view, which was really that of transubstantiation, alleging that there is no substance in matter apart from the accidents, and that therefore Christ cannot be corporally present in the sacrament; because, he says, if so, he must be spatially present, and there will be two material bodies in one space; moreover his body will be in thousands of places at once. Christ, he said, is present spiritually, so that the elements, while remaining what they were, unremoved and undestroyed, are advanced to be something better: omne cui a Deo beneficatur, non absunt, non suferri, non destrui, sed manere et in melius quam erat necessario proteoti. This was the phrase of Gregory of Nyssa.

In a weak moment in 1059 was forced by the pope to recant and assert that "the true body and blood are not only a sacrament, but in truth touched and broken by the hands of the priests and pressed by the teeth of the faithful," and this position remains in every Roman catechism. Such dilemmas as whether a mouse can devour the true body, and whether it is not involved in all the obscenities of human digestive processes, will be ill met by this ruling. Each party doubted the other, and the controversy was often marred by indecencies. As in the 3rd century the Roman church decided in respect of baptism that the sacrament carries the church and not the church the sacrament, so in the dispute over the Eucharist it ended, in spite of more spiritual views essayed by Peter Lombard, by insisting on the more materialistic view at the fourth Lateran Council in 1215, whose decree runs thus:—"The body and blood of Jesus Christ are truly contained in the sacrament of the altar under the species of bread and wine, the bread and wine respectively being transubstantiated into body and blood by divine power, so that in order to the perfecting of the mystery of unity we may ourselves receive from his (body) what he himself receives from ours." In 1564 Urban IV. instituted the Corpus Christi Feast by way of giving liturgical expression to this view.

Communion in One Kind.—Up to about 1100 laymen in the West received the communion in both kinds, and except in a few disciplinary cases the wine was not refused. In 1599, by a decree of Pope Paschal II., children might omit the wine and invalids the bread. The communion of the laity in the bread alone was enjoined by the council of Constance in 1415, and by the council of Trent in 1562. The reformed churches of the West went back to the older rule which Eastern churches had never forsaken.

Mass.—The term mass, which survives in Candlemas, Christmas, Michaelmas, is from the Latin missa, which was in the 3rd century, a technical term for the dismissal of any lay meeting, e.g. of a law-court, and was adopted in that sense by the church as early as Ambrose (c. 330). The catechumens or unbaptized, together with the penitents, remained in church during the Litany, collect, three lections, two psalms and homily. The deacon then cried out: "Let the catechumens depart. Let all catechumens go out." This was the missa of the catechumens. The rest of the rite was called missa fidiculum, because only the initiated remained. Similarly the collect with which often the rite began is the prayer ad colectam, i.e. for the congregation met together or collected. The corresponding Greek word was συναίσθησις.

After the catechumens were gone the priest said: "The Lord be with you, let us pray," and the service of the mass followed. In the West, says Duchesne (Origines, p. 179), not only
EUCARIST

catechumens, but the baptized who did not communicate left the church before the communion of the faithful began (after the communion of the clergy). In Anglican churches non-communicants used to leave the church after the prayer for the Church Militant. Ritualists now keep unconfirmed children in church during the entire rite, through ignorance of ancient usage, in order that they may learn to adore the consecrated elements. For this moment of homage to material elements ritually filled with divine potency may be so exaggerated as to obscure the right ancient significance as a communion of the faithful in mystic food.

Ideas of Reformers.—The 16th-century reformers strove to avoid the literalism of the words “This is my body,” accepted frankly by the Roman and Eastern churches, and urged a Receptionist view, viz. that Christ is in the sacrament only spiritually consumed by worthy recipients alone, the material body not being actually chewed. This is seen by a comparison of other confessions with the Profession of Catholic Faith in accordance with the council of Trent, in the bull of Pius IV., which runs thus:—

“...I profess that in the Mass is offered to God a true, proper and propitiatory sacrifice, for the living and the dead, and that in the most holy sacrament of the Eucharist there is truly and really in substance and in affection the body and blood, together with the soul and divinity of our Lord Jesus Christ, and that there does take place a conversion of the entire substance of the bread into the body, and of the wine into the blood, which is in the Catholic Church doth call Transubstantiation. I also admit that under one of the other species alone the entire and whole Christ and the true sacrament is received.”

The 28th Article of Religion of the Church of England is as follows:—

“The Supper of the Lord...is a Sacrament of our Redemption by Christ’s death; insomuch that to such as rightly, worrhyly, and with faith, receive the same, the bread which we break is a partaking of the Body of Christ, and likewise the cup of blessing is a partaking of the Blood of Christ.

“Transubstantiation...cannot be proved by holy writ...”

The Body of Christ is given, taken and eaten, in the Supper, only after a heavenly and spiritual manner. And the mean whereby the Body of Christ is received and eaten in the Supper is Faith.

“The Sacrament of the Lord’s Supper was not by Christ’s ordinance reserved, carried about, lifted up, or worshipped.”

At the end of the communion rite the prayer-book, in view of the ordinance to receive the Sacrament kneeling, adds the following:—

“It is hereby declared, that thereby no adoration is intended, or ought to be done, either unto the Sacramental Bread or Wine, the body or blood, or unto any other thing whatsoever. For the natural Flesh and Blood. For the Sacramental Bread and Wine remain still in their very natural substances, and therefore may not be adored (for that were idolatry, to be abhorred of Christ). The Natural Body and Blood of our Saviour Christ are in Heaven, and not here; it being against the truth of Christ’s natural Body to be at one time in more places than one.

These monitions and prescriptions are rapidly becoming a dead-letter, but they possess a certain historical interest.

The Helvetic Confession of A.D. 1566 (cap. xxi. De sacra cons Domini) runs as follows:—

“That it may be more rightly and clearly understood how the flesh and blood of Christ can be food and drink of the faithful, and be received by them unto eternal life, let us add these few remarks. Chewing is not merely eating alone, but is a corporal chewing, by which food is taken into the mouth by man, bruised with the teeth and swallowed down into the belly... As the flesh of Christ cannot be corporeally chewed without wickedness and truculence, so it is not food of the belly... There is also a spiritual chewing of the body of Christ, not such that by it we understand the very food to be changed into spirit, but such that, the body and blood of the Lord abiding in their essence and peculiarly, they are spiritually communicated to us, not in any corporeal way, but in a spiritual, through the Holy Spirit which applies and bestows on us those things. The washing through which their wounds are cleansed and blood washed away, by which the Lord betrayed for our sake to death, to wit, remission of sins, liberation and life eternal, so that Christ lives in us and we in him... In addition to the aforesaid spiritual chewing, there is also a sacramental chewing of the Lord’s body, by which the faithful not only partakes spiritually and inwardly of the true body and blood of the Lord, but outwardly by approaching the Lord’s table, receives the visible sacrament of his body and blood. But he who without faith approaches the sacred table, albeit he communicate in the sacrament, yet he perceives not the matter of the sacrament, whence is his unbelief and salvation.

The Augustan Confession presented by the German electors to Charles V. in the section on the Mass merely protests against the view that “the Lord’s Supper is a work (opus) which being performed by a priest earns remission of sin for the doer and for others, and that in virtue of the work done (ex opere operato), without a good motive on the part of the user. Also that being applied for the dead, it is a satisfaction, that is to say, earns for them remission of the pains of purgatory.

The Saxon Confession of Wittenberg, June 1531, while protesting against the same equally absurd notion, is content from trying to define narrowly how Christ is present in the sacrament.

Consistubstantiality.—The symbolical books of the Lutheran Church, following the teaching of Luther himself, declare the doctrine of the real presence of Christ’s body and blood in the eucharist, together with the bread and wine (consistubstantial), as well as the ubiquity of his body, as the orthodox doctrine of the church. One consequence of this view was that the receiving recipients are held to be as really partakers of the body of Christ in, with and under the bread as the faithful, though they receive it to their own hurt. (Hagenbach, Hist. of Doctr. ii. 300.)

Of all the Reformers, the teaching of Zwingli was the farthest removed from that of Luther. At an early period he asserted that the Eucharist was nothing more than food for the soul, and had been instituted by Christ only as an act of commemoration and as a visible sign of his body and blood (Christi und des Erlösers Weisung, 1523, quoted by Hagenbach, Hist. of Doctr. ii. 296, Clark’s translation). But that Zwingli did not reject the higher religious significance of the Eucharist, and was far from degrading the bread and wine into “nuda et inania symbola,” as he was accused of doing, we see from his Fidei ratio ad Corum Imperatores (ib. p. 297).

Original Significance of the Eucharist.—It is doubtful if the attempts of reformers to spiritualize the Eucharist bring us, except so far as they pruned ritual extravagances, nearer to its original significance; perhaps the Roman, Greek and Oriental churches have better preserved it. This significance remains to be discussed; the cognate question of how far the development of the Eucharist was influenced by the pagan mysteries is discussed in the article SACRAMENT.

That the Lord’s Supper was from the first a meal symbolic of Christian unity and commemorative of Christ’s death is quite beyond all question. But Paul, while he saw this much in it, saw much more; or he could not in the same epistle, 1. 18-22 assimilate communion in the flesh and blood of Jesus, on the one hand, to the sacrificial communion with the altar which made Israel after the flesh one; and on the other to the communion with devils attained by pagans through sacrifices offered before idols. It has been justly remarked of the Pauline view, that—‘The union with the Lord Himself, to which those who partake of the Lord’s supper have, is compared with the union which those who partake of a sacrifice have with the deity to whom the altar is devoted—in the case of the Israelites with God, of the heathen unbelieving. This idea that to partake of sacrifice is to devote oneself to the deity, lies at the root of the ancient idea of worship, whether Jewish or heathen; and St Paul uses it as being readily understood. In this context, the symbol is never a mere sign, but a means of real union. ‘The cup is the covenant’” (Prof. Sanday in Hastings’ Dictionary of the Bible, 3, 149).

Paul caps his argument thus:—“Ye cannot drink the cup of the Lord and the cup of demons: ye cannot partake of the table of the Lord and of the table of demons. Or do we provoke the Lord to jealousy? Are we stronger than he? Do we excel his gifts. These are the branches of the tree, so to speak, of the Father of the church, regarded the gods and goddesses as real living supernatural beings, but malignant. They were the powers and principalities with whom he was ever at war. The Lord also is jealous of them, if any one attempt to combine their cult with his, for to do so is to doubt the supremacy of his name above all names. Both in its inner nature then and outward

1 This represents the views of Calvin.
effects the Eucharist was the Christian counterpart of these two other forms of communion of which one, the heathen, was excluded from the first, and the other, the Jewish, soon to disappear. It is their analogue, and to understand it we must understand them, not forgetting that Paul, as a Semite, and his hearers, as converted pagans, were imbued with the sacrificial ideas of the old world.

"A kim," remarks W. Robertson Smith (Religion of the Semites, 1894), "was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life. The members of one kindred looked on themselves as one living whole, a single animated mass of blood, flesh and bones, of which no member could be touched without all the members suffering." "In later times," observes the same writer (op. cit. p. 313), "we find the conception current that any food which two men partake of together, so that the same substance enters into their flesh and blood, is enough to establish some sacred unity of life between them; but in ancient times this significance seems to be always attached to participation in the flesh of a sacracast victim, and the solemn mystery of its death is justified by the consideration that only in this way can the sacred cement be procured, which creates or keeps alive a living bond of union between the worshippers and their god. This cement is nothing else than the actual life of the sacred and kindred animal, which is encompassed in its flesh, but only in a ceremonial way, and so, in the sacred meal, is actually distributed among all the participants, each of whom incorporates a particle of it with his own individual life."

The above conveys the cycle of ideas within which Paul's reflection worked. Christ who knew no sin (2 Cor. v. 21) had been made sin, and sacrificed for us, becoming as it were a new Passover (1 Cor. v. 7). By a mysterious sympathy the bread and wine over which the words "This is my body which is for you," and "This cup is the new covenant in my blood," had been uttered, became Christ's body and blood; so that by partaking of these the faithful were united with each other and with Christ into one kinship. They became the body of Christ, and his blood or life was in them, and they were members of him. Participation in the Eucharist gave actual life, and it was due to their irregular attendance at it that many members of the Corinthian church "were weak and sickly and not a few slept " (i.e. had died). As the author already cited adds (p. 313): "The notion that by eating the flesh, or particularly by drinking the blood, of another living being, a man absorbs its nature or life into his own, is one which appears among primitive peoples in many forms."

But this effect of participation in the bread and cup was not in Paul's opinion automatic, was no mere opus operatum; it depended on the ethical co-operation of the believer, who must not eat and drink unworthily, that is, after refusing to share his meals with the poorer brethren, or with any other guilt in his soul. The phrases "discern the body" and "discern ourselves" in 1 Cor. xi. 20, 31 are obscure. Paul evidently plays on the verb, krión, diakríōn, katakribíōn (κινεῖν, διακρίνειν, κατακρίνειν). The general sense is clear, that those who consume the holy food without a clear conscience, like those who handle sacred objects in impure hands, will suffer physical harm from its contact, as if they were undergoing the ordeal of touching a holy thing. The idea, therefore, seems to be that as we must distinguish the holy food over which the words "This is my body" have been uttered from common food, so we must separate ourselves before eating it from all that is guilty and impure. The food that is tabú must only be consumed by persons who are equally tabú or pure. If they are not pure, it is not a true sacrifice.

The "one" loaf has many parallels in ancient sacrifices, e.g. the Latin tribes when they met annually at their common temple partook of a "single" bull. And in Greek Pantomiae or festivals the sacrificial wine had to be dispensed from one common bowl: "Unto a common cup they come together, and from it pour libations as well as sacrifice," says Aristides Rhetor in his Iskhimia in Neutum, p. 45. To ensure the continued unity of the bread, the Roman church ever leaves over from a preceding consecration half a holy wafer, called ierumnum, which is added in the next celebration.

With what awe Paul regarded the elements mystically identified with Christ's body and life is clear from his declaration in 1 Cor. xi. 27, that he who consumes them unworthily is guilty or holds the Lord's body and blood. This is the language of the ancient ordeal which as a test of innocence required the accused to touch or still better to eat a holy element. A wife who drank the holy water in which the dust of the Sanctuary was mingled (Num. v. 17 foll.) offended so deeply against it, if unfaithful, that she was punished with dropsy and wasting. The very point is paralleled in the Acts of Thomas, ch. xlviii. A youth who has murdered his mistress takes the bread of the Eucharist in his mouth, and his two hands are at once withered up. The apostle immediately invites him to confess the crime he must have committed, "for, he says, the Eucharist of the Lord hath convicted thee."

It has been necessary to consider at such length St Paul's account of the Eucharist, both because it antedates nearly by half a century that of the gospels, and because it explains the significance which the rite had no less for the Gnostics than for the great church. The synoptists' account is to be understood thus: Jesus, conscious that he now for the last time lies down to sleep, feeds his disciples, in the same way as the Paschal, was a new anticipatory of the Milennial regeneration (Matt. xix. 28), institutes, as it were, a blood-brotherhood between himself and them. It is a covenant similar to that of Exodus xxiv., when after the peace-offering of oxen, Moses took the blood in basins and sprinkled half of it on the altar and on twelve pillars erected after the twelve tribes, and the other half on the people, to whom he had first read out the writing of the covenant and said, "Even this blood of the covenant which I shall receive of you all." This must have been the gist of the special revelation which he had received from Christ as to the inner character of a supper which he already found a ritual observance among believers. The Eucharist of the synoptists is rather a covenant or tie of communion between Jesus and the twelve, such as will cause his life to survive in them after he has been parted from them in the flesh. An older prophet would have slain an animal and drunk its blood in common with his followers, or, if not the Paschal, was somehow anticipatory of the millennial. In the East, even now, one who wishes to create a blood tie between himself and his followers and cement them to himself, makes under his left breast an incision from which they each in turn suck his blood. Such barbarism was alien to the spirit of the Founder, who substitutes bread and wine for his own flesh and blood, only imparting to these his own quality by the declaration that they are himself. He broke the bread not in token of approaching death, but in order to its equal distribution. Wine he rather chose than water as a surrogation for his actual blood, because it already in Hebrew sacrifices passed as such. The Hebrews, says Robertson Smith (op. cit. p. 230), "treated it like the blood, pouring it out at the base of the altar." As a red liquid it was a ready symbol of the blood which is the life. It was itself the covenant, for the genitive τοῦ λευκοῦ in Mark xiv. 24 is epezegetic, and Luke xi. 19, Paul rightly substitute the nominative. It was, as J. Wellhausen remarks, a better cement than the bread, because through the drinking of it the very blood of Jesus coursed through the veins of the disciples, and that is why more stress is laid on it than on the bread. To the apostles, as Jews bred and born, the action and words of their master formed a solemn and

1 Das Evangeliul Marci, p. 121.
Eucharist

intelligible appeal. It belongs to the same order of ideas that the headship of the Messianic ecclesia in Judea was assigned after the death of Jesus to his eldest brother James, and after him for several generations to the eldest living representative of his family.

To the modern mind it is absurd that an image or symbol should be taken for that which is imaged or symbolized, and that is why the early history of the Eucharist has been so little understood by ecclesiastical writers. And yet other religions, ancient and modern, supply many parallels, which are considered in the article SACRAMENT.

RESERVATION OF THE Eucharist

The practice of reserving the sacred elements for the purpose of subsequent reception prevailed in the church from very early times. The Eucharist being the seal of Christian fellowship, it was a natural custom to send portions of the consecrated elements by the hands of the deacons to those who were not present (Jn. 13:20, Ac. 20:7, 1 Cor. 11:22, 1 Peter 2:5). From this it was an obvious step to reserve the elements, which prevailed before the end of the 2nd century, for churches to send the consecrated Bread to one another as a sign of communion (the ἐξαραωρία mentioned by Irenaeus, ap. Eus. H. E. v. 24), and for the faithful to take it to their own homes and reserve it in arcae or caskets for the purpose of communicating themselves (Tert. ad Uzor. ii. 5, De orat. 19; St Cypri. De lapsis, 135). Being open to objection on grounds both of superstition and of irreverence, these customs were gradually put down by the council of Laodicea in a.d. 360. But some irregular forms of reservation still continued; the prohibition as regards the lay people was not extended, at any rate with any strictness, to the clergy and monks; the Eucharist was still carried on journeys; occasionally it was buried with the dead; and in a few cases the pen was even dipped in the chalice in subscribing important writings. Meanwhile, both in East and West, the general practice has continued unbroken of reserving the Eucharist, in order that the "mass of the presanctified" might take place on certain "alturigic" days, that the faithful might be able to communicate when there was no celebration, and above all that it might be at hand to meet the needs of the sick and dying. It was reserved in a closed vessel, which took various forms from time to time, known in the East as the ἄρτοφορος, and in the West as the turris, the cápsula, and later on as the pyx. In the East it was kept against the wall behind the altar; in the West, in a locked arumbry in some part of the church, or (as in England and France) in a pyx made in the form of a dove and suspended over the altar.

In the West it has been used in other ways. A portion of the consecrated Bread from one Eucharist, known as the "Fermentum," was long made use of in the next, or sent by the bishop to the various churches of his city, no doubt with the object of emphasizing the solidarity and the continuity of the one Eucharist; and amongst other customs which prevailed for some centuries, from the 8th onward, were those of giving it to the newly ordained in order that they might communicate themselves, and of burying it in or under the altar-slab of a newly consecrated church. At a later date, apparently early in the 14th century, began the practice of carrying the Eucharist in procession in a monstrance; and at a still later period, apparently after the middle of the 16th century, the practice of Benediction with the reserved sacrament, and that of the "forty hours' exposition," were introduced in the churches of the Roman communion. It should be said, however, that most of these practices met with very considerable opposition both from councils and from theologians and canonists, amongst others from the English canonist William Lyndwood (Provinciale, lib. iii. c. 26), on the following grounds amongst others: that the Body of Christ is the food of the soul, that it ought not to be reserved except for the benefit of the sick, and that it ought not to be applied to any other use than that for which it was instituted.

In England, during the religious changes of the 16th century, such of these customs as had already taken root were abolished; and with them the practice of reserving the Eucharist in the churches appears to have died out too. The general feeling on the subject is expressed by the language of the 8th Article, first drafted in 1553, to the effect that "the sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up or worshipped," and by the fact that a form was provided for the celebration of the Holy Eucharist for the sick in their own homes. This latter practice was in accordance with abundant precedent, but had become very infrequent, if not obsolete, for many years before the Reformation. The first Prayer-Book of Edward VI. provided that if there was a celebration of the Eucharist in which the church was to have a day on which a single celebration of the Holy Communion, it should be reserved, and conveyed to the sick man's house to be administered to him; if not, the curate was to visit the sick person before noon and there celebrate according to a form which is given in the book. At the revision of the Prayer-Book in 1552 all mention of reservation is omitted, and the rubric directs that the communion is to be celebrated in the sick person's house, according to a new form; and this practice continued, with certain minor changes, down to the present day. That the tendency of opinion in the English Church during the period of the Reformation was against reservation is beyond doubt, and that the practice actually died out would seem to be equally clear. The whole argument of some of the controversial writings of the time, such as Bishop Cooper on Private Mass, depends upon that fact; and when Cardinal du Perron alleged against the English Church the lack of the reserved Eucharist, Bishop Andrews replied, not that the fact was otherwise, but that reservation was unnecessary in view of the English form for the Communion of the Sick: "So that reservation needeth not; the intent is had without it" (Answers to Cardinal Perron, &c., p. 19, Library of Anglo-Catholic Theology). It does not follow, however, that a custom which has ceased to exist is of necessity forbidden, nor even that what was rejected by the authorities of the English Church in the 16th century is so explicitly forbidden as to be unlawful under its existing system; and not a few facts have to be taken into account in any investigation of the question. (1) The view has been held that in the Eucharist the elements are only consecrated as regards the particular purpose of reception in the service itself, and that consequently what remains unconsumed may be put to common uses. If this view were held (and it has more than once made its appearance in church history, though it has never prevailed), reservation might be open to objection on theological grounds. But such is not the view of the Church of England in her doctrinal standards, and there is an express rubric directing that any that remains of that which was consecrated is not to be carried out of the church, but reverently consumed. There can therefore be no theological obstacle to reservation in the English Church: it is a question of practice only. (2) Nor can it be said that the rubric just referred to is in itself a condemnation of reservation: it is rather directed, as its history proves, against the irreverence which prevailed when it was made; and in fact its wording is based upon that of a pre-Reformation order which coexisted with the practice of reservation (Lyndwood, Provinciale, lib. iii. tit. 26, note q). (3) Nor can it be said that the words of the 8th Article (see
above) constitute in themselves an express prohibition of reservation, strong as their evidence may be as to the practice and feeling of the time. The words are the common property of an earlier age which saw nothing objectionable in reservation for the sick. (4) It is claimed to meet all the objections thus raised by the Bishop Woodworth of Salisbury (then Bishop of Carlisle), that reservation was not actually, though tacitly, continued under the second Prayer-Book of Edward VI, since that book orders that the curate shall “minister,” and not “celebrate,” the communion in the sick person’s house. But such a tacit sanction on the part of the compilers of the second Prayer-Book is in the highest degree improbable, in view of their known opinions on the subject; and an examination of contemporary writings hardly justifies the conclusion that the compilers of the two books so profitably used as the argument would demand. Anyhow, as the bishop notes, this could not be the case with the Prayer-Book of 1661, where the word is “celebrate.” (5) The Elizabethan Act of Uniformity contained a provision that at the universities the public services, with the exception of the Eucharist, might be in a language other than English; and in 1560 there appeared a Latin version of the Prayer-Book, issued under royal letters patent, in which there was a rubric prefixed to the Order for the Communion of the Sick, based on that in the first Prayer-Book of Edward VI (see above), and providing that the Eucharist should be reserved for the sick person if there had been a celebration on the same day. But although the book in question was issued under letters patent, it is not really a translation of the Elizabethan book at all, but simply a reshaping of Aless’s clever and inaccurate translation of Edward VI’s first book. In the rubric in question words are altered here and there in a way which shows that its reappearance can hardly be a mere printer’s error; but in any case its importance is very slight, for the Act of Uniformity specially provides that the English service alone is to be used for the Eucharist. (6) It has been pointed out that reservation for the sick prevails in the Scottish Episcopal Church, the doctrinal standards of which correspond with those of the Church of England. But it must be remembered that the Scottish Episcopal Church has an additional order of its own for the Holy Communion, and that consequently its clergy are not restricted to the services in the Book of Common Prayer. Moreover, the practice of reservation which has prevailed in Scotland for over 150 years would appear to have arisen out of the special circumstances of that church during the 18th century, and not to have prevailed continuously from earlier times. (7) Certain of the divines who took part in the framing of the Prayer-Book do seem to seek to separate prac-tice as that which actually prevailed in their day. But Bishop Sparrow’s words on the subject (Rationale, p. 349) are not free from difficulty on any hypothesis, and Thorndike (Works, v. 278, Library of Anglo-Catholic Theology) writes in such a style that it is often hard to tell whether he is describing the actual practice of his day or that which in his view it ought to be. (8) There appears to be more evidence than is commonly supposed to show that a practice analogous to that of Justin Martyr’s day has been adopted from time to time in England, viz., that of conveying the sacred elements to the houses of the sick during, or directly after, the celebration in church. And in 1899 this practice received the sanction of Dr Westcott, then bishop of Durham. (9) On the other hand, the words of the oath taken by the clergy under the 30th of the Canons of 1604 are to the effect that they will use the form prescribed in the Prayer-Book and none other, except so far as shall be otherwise ordered by lawful authority; and the Prayer-Book does not even mention the reservation of the Eucharist, whilst the Articles mention it only in the way of deprivation.

The matter has become one of no little practical importance owing to modern developments of English Church life. On the one hand, it is widely felt that neither the form for the Communion of the Sick, nor yet the teaching with regard to spiritual communion in the third rubric at the end of that service, is sufficient to meet all the cases that arise or may arise. On the other hand, it is probable that in many cases the desire for reservation has arisen, in part at least, from a wish for some-thing analogous to the Roman Catholic customs of exposition and benediction; and the chief objection to any formal practice of reservation, on the part of many who otherwise would not be opposed to it, is doubtless to be found in this fact. But whatever that may be, the practice of reservation and the Eucharist, either in the open church or in private, has become not uncommon in recent days.

The question of the legality of reservation was brought before the two archbishops in 1899, under circumstances analogous to those in the Lambeth Hearing on Incense (q.v.). The parties concerned were three clergymen, who appealed from the direction of their respective diocesan, the bishops of St Albans and London, and the archbishop of York. In each case the archbishop (Temple) of Canterbury was the principal and the archbishop of York (Maclagan) the assessor, whilst in the latter case the functions were reversed. The hearing extended from 17th to 20th July; counsel were heard on both sides, evidence was given in support of the appeals by two of the clergy concerned and by several other witnesses, lay and clerical, and the whole matter was gone into with no little fulness. The archbishops gave their decision on the 1st of May 1900 in three separate judgments, to the effect that, in Dr Temple’s words, “the Church of England does not at present allow reservation in any form, and that those who think that it ought to be allowed, though perfectly justified in endeavouring to get the proper authorities to alter the law, are not justified in practising reservation until the law has been so altered.” The archbishop of York also laid stress upon the fact that the difficulties in the way of the communion of the sick, when they are really ready for communion, are not so great as has sometimes been suggested.

(London, 1891); Guardian newspaper, July 19 and May 22, 1899; Dr Westcott, Papers on Reservation of the Sacrament (London, 1900); J. S. Franey, Mr Dibdin’s Speech on Reservation, and some of the Evidence (London, 1899); Leech, Reser-vation of the Eucharist in the Scottish Church (Aberdeen, 1890); Bishop J. Woodworth, Considerations on Public Worship (Salisbury, 1901).

**Euchre**, a game of cards. The name is supposed by some to be a corruption of 'karat', to which game it bears some resemblance; others connect it with the Ger. Jacks or Jus, a joke, owing to the presence in the pack, or "deck," of a special card called "the Joker", but neither derivation is quite satisfactory. The "deck" consists of 32 cards, all the cards between the seven and ace being rejected from an ordinary pack. Sometimes the sevens and eights are rejected as well. The "joker" is the best card, i.e. the highest trump. Second in value is the "right bower" (from Dutch boer, farmer, the name of the knave, or knave of trumps; third is the "left bower", the knave of the suit of the same colour as the trump suit as turned at the play; then follow ace, king, queen, &c., in order. Thus if spades are trumps the order is (1) the joker, (2) knave of spades, (3) knave of clubs, (4) ace of spades, &c. The joker, however, is not always used. When it is, the game is called "railroad" euchre. In suits not trumps the cards rank as at whist. Euchre can be played by two, three or four persons. In the cut for deal, the highest card deals, the knave being the highest and the ace the lowest. The knave then places the trump card. The next two each then and three each, or vice versa: when all have received their cards the next card in the pack is turned up for trumps.

**Two-handed Euchre.**—If the non-dealer, who looks at his cards first, is satisfied, he says "I order it up," i.e. he elects to play with this hand; it stands as the trump suit until another is elected by a higher card, or the dealer then rejects one card, which is put face downwards at the bottom of the pack, and takes the trump card into his hand. It, however, the non-dealer is not satisfied with his hand, he says "I pass," on which the dealer can either "adopt," or "take it up," the suit turned up, and proceed as before, or he can pass, turning down the trump card to show that he passes. If both players pass, the non-dealer can make any other suit trumps, by saying "I make it spades," for example, or he can pass again, when the dealer can either make another suit trumps or pass. If both players pass, the hand is at an end. If the trump card is black and either player makes the other black suit trumps, he "makes it next"; if he makes
Eucken—Eulace

A red suit trump he "crosses the suit"; the same applies to trumps in a red suit, mutatis mutandis. The non-leader deals; the dealer must follow suit if he can, but he need not win the trick, nor need he trump if unable to take the suit. The left lower count is a trump, and a trump must be played to it if led. The game is five up. If the player who orders up or adopts makes five tricks (a "match") he scores two points; if four or three tricks, one point; if he makes less than four tricks, he is called "o" or "other play," and no points are scored. A rubber consists of three games, each game counting one, unless the loser has failed to score at all, when the winner counts two tricks, and the loser is called "the jack." When a player has played three tricks, he is said to win the "point." The rubber points are two, as at whist. All three games are played out, even if one player wins all three. The winner scores points if that is the case, but if a score is "lapped," i.e., if the winner makes more than five points in a game, the surplus may be carried on to the next game. The leader should be cautious about ordering up, since the dealer will probably hold one trump in addition to the card he takes in. If the point is certain, the leader should pass, in case the dealer should take the trump. If the dealer "turns it down," it is not wise to "make it," unless the odds are against the suit the dealer picks. The leader counts as "a card in two suits, it is best to make it" next, as the dealer is not likely to have a bower in that suit. The dealer, if he adopts, should discard a singleton, unless it is an ace. If the dealer's score is three, one of a kind ranked second; and, if a singleton, it is not likely to be a singleton. The leader is always wise in play to discard a singleton and not to unguard another suit. With one adversary at four, the trump suit should be adopted even of a light hand.

Three-handed (cut-throat) Euchre.—In this form of the game the option of playing or passing goes round in rotation, beginning with the leader's left. The leader and the two who order up or make, plays against the other two; if he is euchred his adversaries score two each; by other laws he is set back two points, and should his score be at love, he has then to make seven points. The points are scored as in two-handed Euchre.

Four-handed Euchre.—The game is played with partners, cutting and sitting, and the dealing passing, as at whist. If the first player passes, he says "the first player is up," or he may pass. If the first player has ordered up, his partner may say "I take it from you," which means that he will play alone against the two adversaries, the first player's cards being put on the table and not being used in the play. Any player can similarly play "a lone hand," his partner taking no part in the play. Even if the first hand plays alone, the third may still have ordered up, and the leader may take the bridge. But the second hand cannot take it from the dealer. If all four lovers pass, the first player can pass, make it, or play alone, naming the suit he makes. The second hand can "take it in" from the first, or play alone in the suit made by the first, the dealer having a similar right over his own partner. If all four pass again, the hand is at an end and the deals pass. The game is five up, point for four, love for five. A player makes a love if his side scores four: if three tricks, one; if he fails to make three tricks the opponents score four. It is not wise for the first hand to order up unless he has a trump. It is good policy to order up with a trump, to prevent the other side from playing alone, if their score is only one or two and the leader's is four. This right is lost if a player reminds his partner, and can be exerted only when they are at the bridge. If the trump under these circumstances is not ordered up, the dealer should turn down, unless very strong. The second hand should not assist unless truly strong, except when at the point of four-all or four-love. When led through, it is generally wise, ceteris paribus, to head the trick. The dealer should always adopt with a bower in hand, or with one trump if a bower is turned up. At four-all and four-love he should adopt on a weaker hand than another player. If the dealer's partner assists, the dealer should lead a trump after which his partner should make a goal: with a trump, the dealer to play alone if moderately strong. If a player who generally keeps the bridge passes, his partner should rarely play alone.

Extracts from Rules.—If the dealer give too many or too few cards to any player, or exposes two cards in turning up, it is a misdeal and the deals pass. If there is a faced card in the pack, or the dealer deals the cards again, delete one play against him. If a dealer plays without discarding, trumps being ordered up, his side forfeits two points (a lone hand four points) and cannot score during that hand. The revoke or "double" of a lone hand, and no score can be made that hand; a card may be taken back before the trick is quitted, to save a revoke, but it is an exposed card. If a lone player expose a card, no penalty; if he lead out of turn, the card led may be called. If an adversary of a lone player plays out of turn to his lead, all the cards of both adversaries can be called, and are exposed on the table.

Bid Euchre.—This game resembles "Napoléon" (q.v.). It is played with a euchre deck, each player receiving five cards, the others being left face-downwards. Each player "bids," i.e. declares and makes a certain number of tricks, the highest bidder leading and playing first. When six is a highest claim as his partner the player who has the best card of the trump suit, not in the bidder's hand: if it is among the undealt cards, which is ascertained by the fact that no one else holds it, he leads it. The player then play against the next best and so on. The partners then play against the other four.

Eucken, Rudolf Christoph (1846— ), German philosopher, was born on the 5th of January 1846 at Aurich in East Friesland. His father died when he was a child, and he was brought up by his mother, a woman of considerable activity. He was educated at Aurich, where one of his teachers was the later professor Wilhelm Bolt. His philosophical training is certain in the development of his thought. Passing to the university of Göttingen he took his degree in classical philology and ancient history, but the bent of his mind was definitely towards the philosophical side of theology. Subsequently he studied in Berlin, especially under Trendelenburg, whose ethical tendencies and historical treatment of philosophy greatly attracted him. From 1871 to 1874 Eucken taught philosophy at Basel, and in 1874 he became professor of philosophy at Jena. His first book was published in 1875; in 1880 he was awarded the Nobel prize for literature. Eucken's philosophical work is partly historical and partly constructive, the latter being predominant in his earlier, the latter in his later works. Their most striking feature is the close organic relationship between the two parts. The aim of the historical works is to show the necessary connexion between philosophical concepts and the age to which they belong; the same idea is at the root of his constructive speculation. All philosophy is philosophy of life, the development of a new culture, not mere intellectualism, but the application of a vital religious inspiration to the practical problems of society. This practical idealism Eucken described by the term "Activism." In accordance with this principle, Eucken has given considerable attention to social and educational problems.

His chief works are:—Die Methode der aristotelischen Forschung (1872); the important historical study on the history of conceptions, Die Grundbegriffe der Gegenwart (1878; Eng. trans. by M. Stuart Phelps, New York, 1880; 3rd ed. under the title Geistige Strömungen der Gegenwart, 1904; 4th ed., 1909); Geschichte der physischen Terminologie (1879); Probleme zu Forschungen über die Einheit des Geisteslebens (1885); Beiträge zur Geschichte der neueren Philosophie (1886, 1905); Die Einheit des Geisteslebens (1888); Die Lebensphilosophie der griechischen Philosophen (1890); Die Lebensphilosophie der Philosophen des Mittelalters (1893); W. Hough and Boyce Gibson, The Problem of Human Life, 1905; Der Wahrheitsschatz der Religion (1901; 2nd ed., 1905); Thomas Aquinas and Kant (1902); and Der Gegenstand der Lebensanschauung (1903); Philosophie der Geschichte (1907); Der Kampf um einen geistigen Lebensinhalt (1896, 1907); Grundzüge einer neuen Lebensanschauung (1907); Einführung in die Philosophie der Weltanschauung (1909); Volkerkunde (1902); F. de Pogson, 1909, Crown Theological Library); Der Sinn und Wert des Lebens (1909; Eng. trans., 1909); Hauptprobleme der Religionsphilosophie der Gegenwart (1909). The following of Eucken's works also have been translated into English:—Liberty in Teaching in the German Universities (1897); Are the Germans still a Nation of Thinkers? (1898); Progress of Philos., in the 19th Century (1899); The Finnish Question (1899); The Present Status of Religion in Germany (1901). See W. R. Boyce Gibson, Rudolf Eucken's Philosophy of Life (2nd ed., 1907), and God and Us (1905); for the history of Eucken's philosophy see his Lehrbuch der Philosophie (1890) and Grundzüge der Philosophie der Weltanschauung (1907). Also H. Pohlmann, R. Eucken's Theologie mit ihren philosophischen Grundlagen dargestellt (1903); O. Siebert, R. Eucken's Welt- und Lebensanschauung (1907).

Eulace, a very rare mineral, occasionally cut as a gem-stone for the cabinet. It bears some relation to beryl in that it is a silicate containing beryllium and aluminium, but hydrogen is also present, and the analyses of eulace lead to the formula HBeAlSiO₄ or Be(AIOH)SiO₄. It crystallizes in the monoclinic system, the crystals being generally of prismatic habit, striated vertically, and terminated by acute pyramids. Cleavage is perfect, parallel to the clinopinacoid, and this suggested to R. J. Haüy the name eulace, from the Greek ela, easily, and ohr, a stone. The ready cleavage renders the stone fragile with a tendency to chip, and thus detracts from its use for personal ornament. The colour is generally pale-blue or green, though sometimes the mineral is colourless. When cut it resembles
certain kinds of beryl (aquamarine) and topaz, from which it may be distinguished by its specific gravity (3.1). Its hardness (7-5) is rather less than that of topaz. Euclid occurs with topaz at the Ouro Prêto (Villa Rica) in the province of Minas Gerais, Brazil. It is found also with topaz and chrysoberyl in the gold-bearing gravels of the R. Sanarka in the South Urals; and is met with as a rarity in the mica-schist of the Rauris in the Austrian Alps.

**EUCLID** (Εὐκλείδης), of Megara, founder of the Megarian (also called the eristic or dialectic) school of philosophy, was born c. 450 B.C., probably at Megara, though Gelon in Sicily has also been named as his birthplace (Diogenes Laërtius ii. 39) and died in 374. He was one of the most devoted of the disciples of Socrates. Aulus Gallus (vi. 10) states that, when a decree was passed forbidding the Megarians to enter Athens, he regularly visited his master by night in the disguise of a woman; and he was one of the little band of intimate friends who listened to the last discourse. He withdrew subsequently with a number of fellow disciples to Megara, and it has been conjectured, though there is no direct evidence, that this was the period of Plato's residence in Megara, of which indications appear in the *Theaetetus*. He is said to have written six dialogues, of which only the titles have been preserved. For his doctrine (a combination of the principles of Parmenides and Socrates) see MEGARIAN SCHOOL.

**EUCLID,** Greek mathematician of the 3rd century B.C.; we are ignorant not only of the dates of his birth and death, but also of his parentage, his teachers, and the residence of his early years. In some of the editions of his works he is called *Megorenos*, as if he had been born at Megara in Greece, a mistake which arose from confounding him with another Euclid, a disciple of Socrates. Proclus (A.D. 412-485), the authority for most of our information regarding Euclid, states in his commentary on the first book of the *Elements* that Euclid lived in the time of Ptolemy I., king of Egypt, who reigned from 323 to 285 B.C., that he was younger than the associates of Plato, but older than Eratostenes (276-196 B.C.) and Archimedes (287-212 B.C.). Euclid is said to have founded the mathematical school of Alexandria, which was at that time becoming a centre, not only of commerce, but of learning and research, and for this service to the cause of exact science he would have deserved commemoration, even if his writings had not secured him a worthier title to fame. Proclus preserves a reply made by Euclid to King Ptolemy, who asked whether he could not learn geometry more easily than by studying the *Elements*—"There is no royal road to geometry." Pappus of Alexandria (A.D. 290-370) says that Euclid was a man of mild and inoffensive temperament, unpretending, and kind to all genuine students of mathematics. This being all that is known of the life and character of Euclid, it only remains therefore to speak of his works.

Among those which have come down to us the most remarkable is the *Elements* (Στοιχεῖα) (see GEOMETRY). They consist of thirteen books; two more are frequently added, but there is reason to believe that they are the work of a later mathematician, Hypsicles of Alexandria.

The question has often been mooted, to what extent Euclid, in his *Elements*, is a discoverer or a compiler. To this question no entirely satisfactory answer can be given, for scarcely any of the writings of earlier geometers have come down to our times. We are mainly dependent on Pappus and Proclus for the scanty notices we have of Euclid's predecessors, and of the problems which engaged their attention; for the solution of problems, and not the discovery of theorems, would seem to have been their principal object. From these authors we learn that the property of the right-angled triangle had been found out, the principles of geometrical analysis laid down, the restriction of constructions in plane geometry to the straight line and the circle agreed upon, the doctrine of proportion, for both commensurables and incommensurables, as well as loci, plane and solid, and some of the properties of the conic sections investigated, the five regular solids, and the Platonian bodies, and the relation between the volume of a cone or pyramid and that of its circumscribed cylinder or prism discovered. Elementary works had been written, and the famous problem of the duplication of the cube reduced to the determination of two mean proportionals between two given straight lines. Notwithstanding this amount of discovery, it is said that all that is now called Euclidean geometry have made no advance beyond his predecessors (we are told that "he arranged the discoveries of Eudoxus, perfected those of Theaetetus, and reduced to invincible demonstration many things that had previously been more loosely proved"), for his *Elements* supplanted all similar treatises, and, as Apollonius received the title of "the great geometer," so Euclid has come down to later ages as "the elementator."

In the past two centuries parts of the *Elements*, notably the first six books, have been used as an introduction to geometry. Though they are now to some extent superseded in most countries, their long retention is a proof that they were, at any rate, not unsuitable for such a purpose. They are, speaking generally, not too difficult for novices in the science; the demonstrations are rigorous, ingenious and often elegant; the mixture of problems and theorems gives perhaps some variety, and makes their study less monotonous; and, if regard be had merely to the metrical properties of space as distinguished from the graphical, hardly any cardinal geometrical truths are omitted. With these excellences are combined a good many defects, some of them inevitable to a system based on a very few axioms and postulates. Thus the arrangement of the propositions seems arbitrary; associated theorems and problems are not grouped together; the classification, in short, is imperfect. Other objections, not to mention minor blemishes, are the product of the style, arising partly from a defective nomenclature, the treatment of parallels depending on an axiom which is not axiomatic, and the sparing use of superposition as a method of proof.

Of the thirty-three ancient books subservient to geometrical analysis, Pappus enumerates first the *Data* (Σωματον) of Euclid. He says it contained 90 propositions, the scope of which he describes; it now consists of 95. It is not easy to explain this discrepancy, unless we suppose that some of the propositions, as they existed in the time of Pappus, have since been split into two, or that what were once scholia have since been erected into propositions. The object of the *Data* is to show that when certain things—lines, angles, spaces, ratios, &c.—are given by hypothesis, certain other things are given, that is, are determinable. The book, as we are expressly told, and as we may gather from its contents, was intended for the investigation of problems; and it has been conjectured that Euclid must have extended the method of the *Data* to the investigation of theorems. What prompts this conjecture is the similarity between the analysis of a theorem and the method, common enough in the *Elements*, of *reductio ad absurdum*—the one setting out from the supposition that the theorem is true, the other from the supposition that it is false, thence in both cases deducing a chain of consequences which ends in a conclusion previously known to be true or false.

The *Introduction to Harmony* (Εἰσαγωγὴ ἑρμονική), and the *Section of the Scale* (Καταραγμὸν ἔργῳ), treat of music. There is good reason for believing that one at any rate, and probably both, of these books are not by Euclid. No mention is made of them by any writer previous to Ptolemy (A.D. 140), or by Ptolemy himself, and in no ancient codex are they ascribed to Euclid.

The *Phaenomena* (Φαινομένα) contains an exposition of the appearances produced by the motion attributed to the celestial sphere. Pappus, in the few remarks prefatory to his sixth book, complains of the faults, both of omission and commission, of writers on astronomy, and cites as an example of the former the second theorem of Euclid's *Phaenomena*, whence, and from the interpolation of other proofs. David Gregory infers that this treatise is corrupt.

The *Optics* and *Catoptrics* (Οπτικοί, Κατοπτρικοί) are ascribed to Euclid by Proclus, and by Marinus in his preface to the *Data*. The former treatment is made use of by Pappus. The latter circumstance, taken in connexion with the fact that two of the propositions in the sixth book of the *Mathematical Collection* prove the
same things as three in the Optics, is one of the reasons given by Gregory for deeming that work spurious. Several other reasons were found in Gregory's preface to his edition of Euclid's works.

In some editions of Euclid's works there is given a book on the **Divisions of Superficies**, which consists of a few propositions, showing how a straight line may be divided in a given ratio triangles, quadrilaterals and pentagons. This was supposed by John Dee of London, who transcribed or translated it, and entrusted it for publication to his friend Federico Commandino of Urbino, to be the treatise of Euclid referred to by Proclus as Τά καθ' ιδιωτικόν γεωμετρίαν. Dee mentions that, in the manuscript from which he wrote, the book was ascribed to Machomet of Bagdad, and adds two or three reasons for thinking it to be Euclid's. This opinion, however, he does not seem to have held very strongly, nor does it appear that it was adopted by Commandino. The book does not exist in Greek.

The fragment, in Latin, De leni et ponderos, which is of no value, and was printed at the end of Gregory's edition only in order that nothing might be left out, is mentioned neither by Pappus nor Proclus, and occurs first in Bartholomew Zamberti's edition of 1537. There is no reason for supposing it to be genuine.

The following works attributed to Euclid are not now extant:

1. Three books on *Porous* (Παρά τοῦ χρυσοκόμου) are mentioned both by Pappus and Proclus, and the former gives an abstract of them, with the lemmas assumed. (See Porus.).

2. Two books are mentioned, named Τίτου πρὸς εἰδωλοφόρους, which is rendered Lociorum de superficierum by Commandino and supposed by some to be Euclid's. The editions of these lose the analysis of loci, but the four lemmas which refer to them and which occur at the end of the seventh book of the *Mathematical Collection*, throw very little light on their contents. R. Simson's opinion was that they treated of curves of double curvature, and he intended at one time to write a treatise on the subject. (See Trail's *Life of Dr Simson*).

3. Pappus says that Euclid wrote four books on the *Conics Sections* (Παρά τὸ τείχος κώνων), which Appollonius amplified, and to which he added four more. It is known that, in the time of Euclid, the parabola was considered as the section of a right-angled cone, the ellipse that of an acute-angled cone, the hyperbola that of an obtuse-angled cone, and that Appollonius was the first who showed that the three sections could be obtained from any cone. There is no good ground therefore for supposing that the first four books of Appollonius' *Conics*, which are still extant, resemble Euclid's sections even less than Euclid's *Elements* do those of Euclid and Theorematum.

4. A book on *Fallacies* (Παρά τοῦ χρυσοκόμου) is mentioned by Proclus, who says that Euclid wrote it for the purpose of exercising beginners in the detection of errors in reasoning.

This notice of Euclid would be incomplete without some account of the earliest and the most important editions of his works. Passing over the commentators of the Alexandrian school, the first European translator of any part of Euclid is Boethius (500), author of the *De consolatione philosophiae*. His *Euclidis Megarensis geometriae libri duo* contain nearly all the definitions of the first three books of the *Elements*, the postulates, and most of the axioms. The enunciations, with diagrams but no proofs, are given of most of the propositions in the first, second and fourth books, and a few from the third. Some centuries afterwards, Euclid was translated into Arabic, but the only printed version in that language is the one made of the thirteen books of the *Elements* by Nasir Al-Din Al-Tusi (13th century), which appeared at Rome in 1594.

The first printed edition of Euclid was a translation of the fifteen books of the *Elements* from the Arabic, made, it is supposed, by Adelard of Bath (12th century), with the commentaries of the Persian commentators, transcribed at Venice in 1482, printed by the celebrated Raititol, dedicated to the dux Giovanni Mocenigo. This edition represents Euclid very inadequately; the comments are often for the most part incoherent, sometimes omitted, sometimes translated, useless cases are interpolated, and now and then Euclid's order changed.

The first printed translation from the Greek is that of Bartholomew Zamberti, which appeared at Venice in 1505. Its contents will be seen from the title: *Euclidis megarensis philosophi platonici Mathematicarum disciplinarum Janitoris: Habent in hoc volumine quattuor librorum in elementara, elementorum totius rei cu expositione Thomi insinuit mathematicas . . . Quibus . . . adjecta. Deputatum secutum Euclidis volumin xxiii cu expositione Hypsi.*

Fabri's printed Greek text was published at Basle in 1533, with the title *Euclidis ex epheurias in tabulam.Vulgaris graece superlatum omnia.* The text is that of the Basel edition, corrected from the MSS. bequeathed by Sir Henry Savile, and from Savile's own copies or his own copying. The text is a very ancient one, which resembles the Greek on the same page, is for the most part that of Commandino. The French edition has the title *Les Éléments d'Euclide, traduites en Latin et en Français, d'après un manuscrit très-ancien qui était resté inconnu jusqu'à nos jours.* By P. Peyraud, Traducteur des œuvres d'Archimède. It was published at Paris in 1816 and the third in 1818. It contains the *Elements* and the *Data*, which are, says the editor, certainly the only works which remain to us of this ever-celebrated geometer. The texts of the Basel and Toulouse editions are collated with 33 MSS., one of which belonged to the library of the Vatican, but had been sent to Paris by the comte de Pelouse (Monge). The Toulouse MS. was supposed to date from the 10th century; and the basel readings could be used for weight. What may be called the German edition has the title *Euclidis Geometriae. Euclidis Elementa ex opuscula libri in unus versus* (Berlin, 1648). The *Elements* was published in 1748, the *Data* was printed at Berlin in two parts, the first of which appeared in 1826 and the second in 1829. The more ancient texts were collated with three other MSS. Modern standard editions are by Dr Heiberg and Dr Ising, and by the late Prof. L. Heiberg, and by Dr. J. L. Heiberg, vols. i.-v. (Lipsiae, 1883-1888) and by T. L. Heath, *The Thirteen Books of Euclid's Elements*, vols. i.-iii. (Cambridge, 1908). The propositions of the first five books of the *Elements* are now set in modern notation, but the text is very large. The first English translation, published at London in 1570, has the title, *The Elements of Geometry of the most eminent Geometers of Euclid of Megara. Faithfully (now first) translated into the English tongue, by Henr. Billings.

The text of the *Elements* has been annexed certain Scholia, Annotations and Inventions, of the best Mathematicians, both of time past and in this our age. The first at London, 1570, printed by Richard Bree. The translation appeared at Urbino in 1573; a Spanish version, *Los Seis Libros primeros de la geometria de Euclides. Traducidos en letra moderna por Rafael de Medinaceli*, appeared at Seville in 1576; and a Turkish one, translated from the edition of J. Bonnycote by Husain R'fi, at Bulaq in 1825. Dr Robert Simson's editions of the first six and the eleventh and twelfth books of Euclid's *Elements*, and of the *Data*, are the editions of which the English translations are made.

**AUTHORITIES.—** The authors and editions above referred to: Fabricius, *Bibliotheca Graeca*, vols. iv.; Murer's *Liberator* der mathematischen Wissenschaften; Heiberg's *Historia mathematica*, vol. i.

**EUROCRATES,** king of Bactria (c. 172-129 B.C.), came to the throne by a rebellion against the dynasty of Euthydemos, the last of the Demetriadii. The Athenian authority was challenged by a great many other pretenders and Greek dynasts in Sogdiana, Aria (Herat), Drangiana (Sijistan), &c., whose names—Pantaleon, Agathocles, Antimachus, Antalacidus “the victorious” (πλευψαρως), Plato, whose unique coin is dated from the year 147 of the Seleucid era (=166 B.C.), and others—are known only from coins with Greek and Indian legends. In the west the Parthian king Mithridates I. began to enlarge his kingdom and attacked Eucratides; he succeeded in incorporating two provinces between Bactria and Parthia, called by Strabo “the country of Aspiones and Turius,” two Iranian names. But the principal opponent of Eucratides was Demetrius (q.v.) of India, who attacked him with a large army of “300,000 men”; Eucratides fled with 300 men into a fortress and was besieged. But at last he beat
EUDAEMONISM—EUDOCIA MACREMBOLOTISSA

Demetrius, and conquered a great part of western India. According to Apollodorus of Artemia, the historian of the Parthians, he ruled over 100 towns (Strabo xxi. 4, 6); and the extent of his kingdom over Bactria, Sagodina (Bokhara), Drangiana (Sijistan), Kabul and the western Punjab is confirmed by numerous coins. On these coins, which bear Greek and Indian legends (in Kharoshiti writing, cf. BACTRIA), he is called “the great King Eucratides.” On one his portrait and name are associated on the reverse with those of Heliocles and Laodice; Heliocles was probably his son, and the coin may have been struck to celebrate his marriage with Laodice, who seems to have been a Scecid princess. In Bactria Eucratides founded a Greek city, Eucratideia (Strabo xi. 516, Ptolem. vi. 11, 8). On his return from India Eucratides was (about 150 B.C.) murdered by his son, whom he had made co-regent (Justin 41, 6). This son is probably the Heliocles just mentioned, who on his coins calls himself “the Just” (βασιλεὺς Ἡλειοκλῆς δικαίου). In his time the Graeco-Bactrian kingdom lost the countries north of the Hindu Kush. Mongolian tribes, the Yue-chi of the Chinese, called by the Greeks Scythians, by the Indians Saka, among which the Tochari are the most conspicuous, invaded Sagodiana in 159 B.C. and conquered Bactria in 139. Meanwhile the Parthian kings Mithradates I. and Phraates II. conquered the provinces in the west of the Hindu Kush (Justin 41, 6, 8); for a short time Mithradates I. extended his dominion to the borders of India (Diod. 33, 18, Orosius v. 4, 16). When Antiochus VII. Sidetes tried once more to restore the Greek language in literature in 150, Philip II. defeated him at Ilium and took the Scythians (Justin 42, 1, 1); but after his decisive victory in 129 he was attacked by them and fell in the battle. The changed state of affairs is shown by the numerous coins of Heliocles; while his predecessors maintained the Attic standard, which had been dominant throughout the Greek east, he on his later coins passes over to a native silver standard, and his bronze coins became quite barbarous. Besides his coins he possesses coins of many other Greek kings of these times, most of whom take the epithet of “invincible” (ἀνικήτωρ) and “saviour” (σωτήρ). They are records of a desperate struggle of the Greeks to maintain their nationality and independence in the Far East; one usurper after the other rose to fight for the rescue of the kingdom. But these internal wars only accelerated the destruction; about 120 B.C. almost the whole of eastern Iran was in the hands either of a Parthian dynasty or of the Mongol invaders, who are now called Indo-Scythians. Only in the Kabul valley and the eastern part of Bactria, which Eucratides maintained himself for about two generations longer (see MANANDER).

EUDAEMONISM (from Gr. εὐδαιμονία, literally the state of being under the protection of a benign spirit, "a good genius"); in ethics, the name applied to theories of morality which find the chief good of man in some form of happiness. The term Eudaemonia has been taken in a large number of senses, with consequent variations in the meaning of Eudaemonism. To Plato the "happiness" of all the members of a state, each according to his own capacity, was the final end of political development. Aristotle, as usual, adopted "eudaemonia" as the term which in popular language most nearly represented his idea and made it the keyword of his ethical doctrine. None the less he greatly expanded the content of the word, until the popular idea was practically lost: if a man is to be called εὐδαιμον, he must have all his powers performing their functions freely in accordance with virtue, as well as a reasonable degree of material well-being; the highest conceivable good of man is the life of contemplation. Aristotle further held that the good man in achieving virtue must experience pleasure (ἡδονή), which is, therefore, not the same as, but the sequel to or concomitant of eudaemonia. Subsequent thinkers have to a greater or less degree identified the two ideas, and much confusion has resulted. Among the ancients the Epicureans expressed all eudaemonia in terms of pleasure. On the other hand attempts have been made to separate hedonism, as the doctrine of a pleasure principle, from eudaemonism, a condition of enduring mental satisfaction. Such a distinction involves the assumptions that bodily pleasures are generically different from mental ones, and that there is in practice a clearly marked dividing line,—both of which hypotheses are frequently denied. Among modern writers, James Beattie (Ethical Princ., 1804) resumes Aristotle's position, and places Eudaemonism as the mean between the Ethics of Sensibility (hedonism) and the Ethics of Rationality, each of which overlooks the complex character of human life. The fundamental difficulty which confronts those who would distinguish between pleasure and eudaemonia is that all pleasure is ultimately a mental phenomenon, whether it be roused by food, music, doing a noble action or committing a theft. There is a marked disposition on the part of critics of hedonism to confuse pleasure with animal pleasure or "passion,"—in other words, with a pleasure phenomenon in which the predominant feature is entire lack of self-control, whereas the word "pleasure" has strictly no such connotation. Pleasure is strictly nothing more than the state of being pleased, and hedonism the theory that man's chief good consists in acting in such a way as to bring about a continuous succession of such states. That they are in some cases produced by physical or sensory stimuli does not constitute them irrational, and it is purely arbitrary to confine the word pleasure to those cases in which such stimuli are the proximate causes. The value of the term Eudaemonism as an antithesis to Hedonism is thus very questionable.

EUDOCIA AUGUSTA (c. 301–c. 400), the wife of Theodosius II., East Roman emperor, was born in Athens, the daughter of the sophist Leontius, from whom she received a thorough literary education. During the absence of her father by reason of his military campaigns, she showed herself to be a Provide the text of an article on Eudaemonism, focusing on its definition and historical importance. This should be an informative piece for a general audience. The text should be written in a clear and concise manner, avoiding overly technical language. The article should also include a brief overview of its historical context and how Eudaemonism was practiced in different cultures throughout history. Finally, the article should conclude with a summary of the current state of the research on Eudaemonism.
favour of her son Michael and retire to a convent, where she died.
The dictionary of mythology entitled 'Iliad' ("Collection of Violets"), which formerly used to be ascribed to her, was not compiled till 1543 (Constantine Palaeokappra).

EUDOXIA LOPUKHINA (1669-1731), tsaritsa, first consort of Peter the Great, was the daughter of the boyarin Theodore Lopukhin. Peter, then a youth of seventeen, married her on the 27th of January 1689 at the command of his mother, who hoped to wean him from the wicked ways of the German suburb of Moscow by wedding him betimes to a lady who was as pious as she was beautiful. The marriage was in every way unfortunate. Accustomed from her infancy to the monastic seclusion of the korema, or women's quarters, Eudosia's mental horizon did not extend much beyond her embroidery-frame or her illuminated service-book. From the first her society bored Peter unaccountably, and after the birth of their second, short-lived son Alexander, he practically deserted her. In 1698 she was unceremoniously sent off to the Pokrovsky monastery at Suzdal for refusing to consent to a divorce, though it was not till June 1699 that she disappeared from the world beneath the hood of sister Elena. In the monastery, however, she was held in high honour by the archimandrite; the nuns persisted in regarding her as their lawful empress, and she was permitted to maintain an extraordinary degree of latitude, unknown to Peter, who dragged her from her enforced retreat in 1718 on a charge of adultery. As the evidence was collected by Peter's creatures, it is very doubtful whether Eudosia was guilty, though she was compelled to make a public confession. She was then divorced and con-
signed to the remote monastery of Ladoga. Here she remained for ten years till the accession of her grandson, Peter II., when the reactionaries proposed to appoint her regent. She was escorted with great ceremony to Moscow in 1728 and ex-
hibited to the people attired in the splendid, old-fashioned robes of a tsaritsa; but years of rigid seclusion had dulled her wit, and her best friends soon convinced themselves that a convent was a much more suitable place for her than a throne. An allowance of 60,000 roubles a year was accordingly assigned to her; and she disappeared again in a monastery at Moscow, where she died in 1731.

EUDOXUS, of Cnidos, Greek savant, flourished about the middle of the 4th century B.C. It is chiefly as an astronomer that his name has come down to us (see Astronomy and Zodiac). From a life by Diogenes Laertius, we learn that he studied at Athens under Plato, but, being dismissed, passed over into Egypt, where he remained for sixteen months with the priests of Heli-
polis. He then taught physics in Cypicus and the Propontis, and subsequently, accompanied by a number of pupils, went to Athens. Towards the end of his life he returned to his native place, where he died. Strabo states that he discovered that the solar year is longer than 365 days by 6 hours; Vitruvius that he invented a sun-dial. The Phaenomena of Aratus is a poetical account of the astronomical observations of Eudoxus. Several works have been attributed to him, but they are all lost; some fragments are preserved in the extant 'Toos Άρακου and Ευδοξου φαυνωμένων Εφύρων' of the astronomer Hipparchus (ed. C. Minutius, 1854). According to Aristotle (Ethics x. 2), Eudoxus held that pleasure was the chief good, because (1) all beings sought it and endeavoured to escape its contrary, pain; (2) it is an end in itself, not a relative good. Aristotle, who speaks highly of the sincerity of Eudoxus's convictions, while giving a qualified approval to his arguments, considers him wrong in not distinguishing the different kinds of pleasure and in making pleasure the sumnum bonum.

See J. A. Leceorne, Sur les éléments et les travaux d'Eudoxe de Cnidos, d'après les fragments (1841); C. Y. Schiaparelli, Le Sfere omometriche di Eudossio (Milan, 1876); T. H. Martin in Académie des inscriptions, 3rd of October, 1879; article in Ersch and Gruber's Allgemeine Enzyklopädie.

EUDOXUS, of Cyzicus, Greek navigator, flourished about 130 B.C. He was employed by Ptolemy Euergetes, who sent out a fleet under him to explore the Arabian Sea. After two successful voyages, Eudosia left the Egyptian service, and proceeded to Cadiz with the object of fitting out an expedition for the purpose of African discovery; and we learn from Strabo, who utilized the results of his observations, that the veteran explorer made at least two voyages southward along the coast of Africa.

There is a good account of Eudosia in E. H. Bunbury, History of Ancient Geography, ii. (1879); see also P. Gaffarei, Eudosie de Cyzique (1873).

EUGENE OF SAVOY [Francois Eugene]. PRINCE (1663-1736), fifth son of Prince Eugene Maurice of Savoy-Carignano, count of Soissons, and of Olympia Mancini, niece of Cardinal Mazarin, was born at Paris on the 18th of October 1663. Originally destined for the church, Eugene was known at court as the petit abbé, but his own predilection was strongly for the army. His mother, however, had fallen into disgrace at court, and his application for a commission, repeated more than once, was refused by Louis XIV. This, and the influence of his mother, produced in him a lifelong resentment against the king. Having quitted France in disgust, he proceeded to Vienna, where his father had received the dignity of prince. Eugene served with the Austrian army during the campaign of 1683 against the Turks. He displayed his bravery in a cavalry fight at Petronell (7th July) and in the great battle for the relief of Vienna. The emperor now gave him the command of a regiment of dragoon. At the capture of Buda in 1686 he received a wound (3rd August), but he continued to serve up to the siege of Belgrade in 1688, in which he was dangerously wounded. At the instigation of Louvois, a decree of banishment from France was now issued against all Frenchmen who should continue to serve in foreign armies. "The king will see me again," was Eugene's reply when the news was communicated to him; he continued his career in foreign service.

Prince Eugene's next employment was in a service that required diplomatic as well as military skill (1686). He was sent by the emperor Leopold to Italy with the view of binding the duke of Savoy to the coalition against France and of co-operating with the Italian and Spanish troops. Later in 1680 he served on the Rhine and was again wounded. He returned to Italy in time to take part in the battle of Staffarda, which resulted in the defeat of the coalition at the hands of the French marshal Catiniat; but in the spring of 1691 Prince Eugene, having secured reinforcements, caused the siege of Coni to be raised, took possession of Carmagnola, and in the end completely defeated Catiniat. He followed up his success by entering Dauphine, where he took possession of Embrun and Gap. After another campaign, which was uneventful, the further prosecution of the war was abandoned owing to the defection of the duke of Savoy from the coalition, and Prince Eugene returned to Vienna, where he soon afterwards received the command of the army in Hungary, on the recommendation of the veteran count Rüdiger von Starhemberg, the defender of Vienna in 1683. It was about this time that Louis XIV. secretly offered him the post of a marshal of France, with the government of Champagne which his father had held, and also a pension. But Eugene rejected these offers with indignation, and proceeded to operate against the Turks commanded by Kara Mustapha. After some skilful manoeuvres, he surprised the enemy (September 11th, 1697) at Zenta, on the Theiss. His attack was vigorous and daring, and the victory was one of the most complete and important ever won by the Austrian arms. Formerly it was often stated that the battle of Zenta was fought against express orders from the court, that Eugene was placed under arrest for violating these orders, and that a proposal to bring him before a council of war was frustrated only by the threatening attitude of the citizens of Vienna. This story, minute in details as it is, is entirely without foundation. After a further period of manoeuvres, peace was at length concluded at Karlowitz on the 26th of January 1699.

Two years later he was again in active service in the War of
the Spanish Succession (q.v.). At the beginning of the year 1701 he was sent into Italy once more to oppose his old adversary, Prince Eugene. He achieved his end in the affair of the mountains from Tirol into Italy in spite of almost insurmountable difficulties (Journ. d. militärwissensch. Verein, No. 5, 1907), forcing the French army, after sustaining several checks, to retire behind the Oglio, where a series of reverses equally unexpected and severe led to the recall of Catiner in disgrace.

The incapable duke of Villeroi, who succeeded to the command of which Catiner had been deprived, ventured to attack Eugene at Chiari, and was repulsed with great loss. And this was only the forerunner of more signal reverses; for, in a short time, Villeroi was forced to abandon the whole of the Mantuan territory and to take refuge in Cremona, where he seems to have considered himself secure. By means of a stratagem, however, Eugene penetrated into the city during the night, at the head of 2000 men, and, though he found it impossible to hold the town, succeeded in carrying off Villeroi as a prisoner. But as the duke of Vendôme, a much abler general, replaced the captive, the incursion, daring though it was, proved anything but advantageous to the Austrians. The generalship of his new opponent, and the fact that the French army had been largely reinforced, while reinforcements had not been sent from Vienna, forced Prince Eugene to confine himself to a war of observation. The campaign was terminated by the sanguinary battle of Luzzara, fought on the 1st of August 1702, in which each party claimed victory. Both armies, finding themselves in observation of each other's quarters, Eugene returned to Vienna, where he was appointed president of the council of war. He then set out for Hungary in order to combat the insurgents in that country; but his means proving insufficient, he effected nothing of importance.

The collapse of the revolt, however, soon freed the prince for the more important campaign in Bavaria, where, in 1704, he made his first campaign along with Marlborough. Similarity of tastes, views and talents soon established between these two great men a friendship which is rarely to be found amongst military chiefs, and contributed in the fullest measure to the success which the allies obtained. The first and perhaps the most important of these successes was that of Hochstädt or Blenheim (q.v.) on the 3rd of August 1704, where the English and imperial troops triumphed over one of the finest armies that France had ever sent into Germany.

But since Prince Eugene had quitted Italy, Vendôme, who commanded the French army in that country, had obtained various successes against the duke of Savoy, who had once more joined Austria. The emperor deemed the crisis so serious that he recalled Eugene and sent him to Italy to the assistance of his ally. Vendôme at first opposed great obstacles to the plan which the prince had formed for carrying succours into Piedmont; but after a variety of marches and counter-marches, in which both commanders displayed signal ability, the two armies met at Cassano (August 16, 1705), where a deadly engagement ensued, and Prince Eugene received two severe wounds which forced him to quit the field. This accident decided the fate of the battle and for the time suspended the prince's march towards Piedmont. Vendôme, however, was recalled, and La Feuillade (who succeeded him) was incapable of long arresting the progress of such a commander as Eugene. After once more passing several rivers in presence of the French army, and executing one of the most skilful and daring marches he had ever performed, the latter appeared before the entrenched camp at Turin, which place the French were now besieging with an army eighty thousand strong. Prince Eugene had only thirty thousand men; but his antagonist the duke of Orleans, though full of zeal and courage, wanted experience, and Marshal Marsin, his adiutus, held powers from Louis XIV. which could not fail to produce dissensions in the French headquarters. With equal courage and address, Eugene profited by the misunderstandings between the French generals; and on the 7th of September 1706 he attacked the French army in its entrenchments and gained a victory which decided the fate of Italy. In the heat of the battle Eugene received a wound, and was thrown from his horse.

His recompense for this important service was the government of the Milanese, of which he took possession with great pomp on the 1st of November 1706. He was also made lieutenant-general to the emperor Joseph I.

The attempt which he made against Toulon in the course of the same year failed completely, because the invasion of the kingdom of Naples retarded the march of the troops which were to have been employed in it, and this delay afforded Marshal de Tésée time to make good dispositions. Obliged to renounce his project, therefore, the prince went to Vienna, where he was received with great enthusiasm both by the people and by the court. "I am very well satisfied with you," said the emperor, "excepting on one point only, which is, that you expose yourself too much." This monarch immediately despatched Eugene to Holland, and to the different courts of Germany, in order to forward the necessary preparations for the campaign of the following year, 1708 (see Spanish Succession, War of the).

Early in the spring of 1708 the prince proceeded to Flanders, in order to assume the command of the German army which his diplomatic ability had been mainly instrumental in assembling, and to unite his forces with those of Marlborough. The campaign was opened by the victory of Oudenarde (q.v.), to which the perfect union of Marlborough and Eugene on the one hand, and the misunderstanding between Vendôme and the duke of Burgundy on the other, seem to have equally contributed. The French immediately abandoned the Low Countries, and, after the battle of Oudenarde, the Flanders army, covered by that of Marlborough, making the siege of Lille. The French governor, Boufflers, made a glorious defence, and Eugene paid a flattering tribute to his valour in inviting him to prepare the articles of capitulation himself, with the words "I subscribe to everything beforehand, well persuaded that you will not insert anything unworthy of yourself or of me." After this important conquest, Eugene and Marlborough proceeded to the Hague, where they were received in the most flattering manner by the public, by the states-general, and above all, by their esteemed friend the pensionary Heinsius. Negotiations were then opened for peace, but proved fruitless. In 1709 France put forth a supreme effort, and placed Marshal Villars, her best living general, in command. The events of this year were very different to those of previous campaigns, and the bloody battle of Malplaquet (q.v.), though a victory for Marlborough and Eugene, led to little result, and this at the cost of enormous loss.

The Dutch army, it is said, never felt the slaughter of Malplaquet; indeed, the success was so dearly bought that the allies found themselves soon afterwards out of all condition to undertake anything. Their army accordingly went into winter quarters, and Prince Eugene returned to Vienna, whence the emperor almost immediately despatched him to Berlin. From the king of Prussia the prince obtained everything which he had been instructed to require; and having thus fulfilled his mission, he returned into Flanders, where, excepting the capture of Douai, Bethune and Aire, the campaign of 1710 presented nothing remarkable. On the death of the emperor Joseph I. in April 1711, Prince Eugene, in concert with the empress, exerted his utmost endeavours to secure the crown to the archduke, who afterwards ascended the imperial throne under the name of Charles VI. In the same year the changes which had occurred in the policy, or rather the caprice, of Queen Anne, brought about an approximation between England and France, and put an end to the influence which Marlborough had hitherto possessed. When this political revolution became known, Prince Eugene immediately repaired to London, charged with a mission from the emperor to re-establish the credit of his illustrious companion in arms, as well as to re-attach England to the coalition. The mission having proved unsuccessful, the emperor found himself under the necessity of making the campaign of 1712 with the aid of the Dutch alone. The defection of the English, however, did not induce Prince Eugene to abandon his favourite plan of invading France. He resolved, at whatever cost, to penetrate into Champagne; and in order to support his operations by the
EUGENE

possession of some important places, he began by making himself master of Quesnoy. But the Dutch, having been surprised and beaten in the battles of Denain, where Prince Eugene had placed them at too great a distance to receive timely support in case of an attack, he was obliged to raise the siege of Landrecies, and to abandon the project which he had so long cherished. This was the last campaign in which Austria acted in conjunction with her allies. Abandoned first by England and then by Holland, the emperor, notwithstanding these desertions, still wished to pursue the war in Germany; but Eugene was unable to relieve either Landau or Freiburg, which were successively obliged to capitulate; and seeing the Empire thus laid open to the armies of France, and even the Austrian hereditary states themselves exposed to invasion, the prince counselled his master to make peace. Sensible of the prudence of this advice, the emperor immediately entrusted Eugene with full powers to negotiate a treaty of peace, which was concluded at Rastadt on the 6th of March 1714. On his return to Vienna, Prince Eugene was employed for a time in political matters, and at this time he exchanged the government of the Milanese for that of the Austrian Netherlands.

It was not long, however, before he was again called on to assume the command of the army in the field. In the spring of 1716 the emperor, having concluded an offensive alliance with Venice against Turkey, appointed Eugene to command the army of Hungary; and at Peterwardein he gained (5th of August 1716) a signal victory over a Turkish army of more than five times the size of his own. In recognition of this service to Christendom the pope sent to the victorious general the consecrated hat and sword which the court of Rome was accustomed to bestow upon those who had triumphed over the infidels. Eugene won another victory in this campaign at Temesvár. But the ensuing campaign, that of 1717, was still more remarkable on account of the battle of Belgrade. After having besieged the city for a month Eugene found himself in a most critical, if not hopeless situation. He had to deal not only with the garrison of 35,000 men, but with a relieving army of 200,000, and his own force was only about 40,000 strong. In these circumstances the only possible deliverance was by a bold and decided stroke. Accordingly on the morning of the 16th of August 1717 Prince Eugene ordered a general attack, which resulted in the total defeat of the enemy with an enormous loss, and in the capitulation of the city six days afterwards. The prince was wounded in the heat of the action, and died on the thirteenth of October, of the wounds he had received in the battle of field of battle. On his return to Vienna he received, among other testimonies of gratitude, a sword valued at 80,000 florins from the emperor. The popular song "Prinz Eugen, der edle Ritter," commemorates the victory of Belgrade. In the following year, 1718, after some fruitless negotiations with a view to the conclusion of peace, he again took the field; but the treaty of Passarowitz (July 21, 1718) put an end to hostilities at the moment when the prince had well-founded hopes of obtaining still more important successes than those of the last campaign, and even of reaching Constantinople, and dictating a peace on the shores of the Bosporus.

As the government of the Netherlands, up to 1724 held by Eugene, had now for some reason been bestowed on a sister of the emperor, the prince was appointed viceroy-general of Italy, with a pension of 300,000 florins. Though still retaining his official position and much of his influence at court, his personal relations with the emperor were not so cordial as before, and he suffered from the intrigues of the Spanish or anti-German party. The most remarkable of these political intrigues was the conspiracy of Tessedici and Nimptsch against the prince in 1719. On discovering this the prince went to the emperor and threatened to lay down all his offices if the conspirators were not punished, and after some resistance he achieved his purpose. During the years of peace between the treaty of Passarowitz and the War of the Polish Succession, Eugene occupied himself more of than twice with literature, to which he had hitherto been able to devote little of his time. This new interest led him to correspond with many of the most eminent men in Europe. But the contest which arose out of the succession of Augustus II. to the throne of Poland having afforded Austria a pretext for attacking France, war was resolved on, contrary to the advice of Eugene (1734). In spite of this, however, he was appointed to command the army destined to act upon the Rhine, which from the commencement had very superior forces opposed to it; and if it could not prevent the capture of Philippsburg after a long siege, it at least prevented the enemy from entering Bavaria. Prince Eugene, having now attained his seventy-first year, no longer possessed the vigour and activity necessary for a general in the field, and he welcomed the situation which was conformed to on the 3rd of October 1740. On his return to Vienna his health declined more and more, and he died in that capital on the 21st of April 1736, leaving an immense inheritance to his niece, the princess Victoria of Savoy.

Of a character cold and severe, Prince Eugene had almost no other passion than that of glory. He died unmarried, and seemed so little susceptible to female influence that he was styled a Mars without a Venus. That he was one of the great captains of history is universally admitted. He was strangely unlike the commanders of his time in many respects, though as a matter of course he was, when he saw fit to follow the accepted rules, equal to any in careful and methodical strategy. The special characteristics of his generalship were imagination, fiery energy, and a tactical resolution which was rare indeed in the 18th century. Despising the lives of his soldiers as much as he exposed his own, it was always by persevering efforts and great personal hazard that he obtained his victories. His success raised the reputation of the Austrian army to a point which it never reached either before or since his day. War was with him a passion. Always on the march, in camps, or on the field of battle during more than fifty years, and under the reigns of three emperors, he had scarcely passed two years together without fighting. Yet his political activity was not inconsiderable, and his advice was always sound and well-considered; while in his government of the Netherlands, which he exercised through the marquis de Prie, he showed himself resolutely opposed to all the wild schemes, such as Law's Mississippi project, in which the times were so fertile. His interest in literature and art has been alluded to above. His palace in Vienna, and the Belvedere near that city, his library, and his collection of paintings, were renowned. Prince Eugene was a man of the middle size, but, upon the whole, well made; the cast of his visage was somewhat long, his mouth moderate and almost always open; his eyes were black and animated, and his complexion such as became a warrior.

See A. v. Arneth, Prinz Eugen (3 vols., Vienna, 1858; 2nd ed., 1864); H. v. Sybel, Prinz Eugen von Savoyen (Munich, 1868); Austrian official history, Feldzüge des Prinzen Eugen von Savoyen (Vienna, 1853); J. Wallone, Prinz Eugen (London, 1888); Heller, Militärische Korrespondenz des Prinzen Eugens (Vienna, 1848); Keyser, Prinz Eugen (Freiburg, 1899); österr. militärische Zeitschrift ("Streifzüge"); Riedler's österr. Archiv für Geschichte (1831-1834); Archivio storico italo, vol. 17; Mittel der Instituts für österr. Geschichtsforschung, vol. 13.

The political memoirs attributed to Prince Eugene (ed. Sartori, Tubingen, 1812) are spurious; see Böhm, Die Schüttling der hinterlassenen politischen Schriften des Prinzen Eugen (Freiburg, 1900).

EUGENE, a city and the county-seat of Lane county, Oregon, U.S.A., on the Willamette river, at the head of navigation, about 125 m. S. of Portland. Pop. (1900) 3236, of whom 237 were foreign-born; (1910 Federal census) 909. Eugene is served by the Southern Pacific railroad and by interurban electric railway. It is situated on the edge of a broad and fertile prairie, at the foot of a ridge of low hills and within view of the peaks of the Coast Range; the streets are pleasantly shaded with Oregon maples. The city is most widely known as the seat of the University of Oregon. This institution, opened in 1876 and having 95 instructors and 734 students in 1907-1908, occupies eight buildings on a grassy slope along the river bank, and embraces a college of literature, science and the arts, a college of engineering, a graduate school, and (attached) a school of law and a school of medicine. In the city is the Eugene Divinity School of the Disciples of Christ, opened in 1885. Eugene is the commercial center of an extensive agricultural district; does a large business
in grain, fruit, hops, cattle, wool and lumber; and has various manufactures, including flour, lumber, woollen goods and canned fruit. Eugene was settled in 1834, and was first incorporated in 1864.

**EUGENICS** (from the Gr. ἐγενεσις, well born), the modern name given to the science which deals with the influences which improve the inborn qualities of a race, but more particularly with those which develop them to the utmost advantage, and which generally serves to disseminate knowledge and encourage action in the direction of perpetuating a higher racial standard. The founder of this science may be said to be Sir Francis Galton (q.v.), who has done much to further its study, not only by his writings, but by the establishment of a research fellowship and scholarships in the University of London. He was professor of Anthropology in the University of London and author of "Folk-Types," a work which is the basis of the science as laid down by Galton is to bring as many influences as can reasonably be employed, to cause the useful classes in the community to contribute more than their proportion to the next generation. It can hardly be said that the science has advanced beyond the stage of disseminating a knowledge of the laws of heredity, so far as they are surely known, and endeavouring to promote their further study. Useful work has not been done in the compilation of statistics of the various conditions affecting the science, such as the rates with which the various classes of society in ancient and modern nations have contributed in civic usefulness to the population at various times, the inheritance of ability, the influences which affect marriage, &c. Works by Galton bearing on eugenics are: "Hereditary Genius" (1869); "Facetiae" (1869); "Inheriting Inheritance" (1887); a Huxley Lecture of the Anthrop. Inst. on the Possible Improvement of the Human Breed under the existing Conditions of Law and Sentiment (1901); see also "Biometrika" (a journal for the statistical study of biological problems, of which the first volume was published in 1902).

**EUGÈNE [MARIE-EUGÈNIE-IGNACE- AUGUSTINE DE MONTIJO]** (1826–1852), wife of Napoleon III., emperor of the French, daughter of Don Cipriano Guzman y Porto Carrero, count of Teba, subsequently count of Montijo and grandee of Spain, was born at Grenada on the 5th of May 1826. Her mother was a daughter of William Kirkpatrick, United States consul at Malaga, a Scotsman by birth and an American by nationality. Her childhood was spent in Madrid, but after 1834 she lived with her mother and sister chiefly in Paris, where she was educated, like so many French girls of good family, in the convent of the Sacré Cœur. When Louis Napoleon became president of the Republic she appeared frequently with her mother at the balls given by the prince president at the Elysée, and it was here that she made the acquaintance of her future husband. He died by her side in 1852. Mother and daughter were invited to Fontainebleau, and in the picturesque hunting parties the beautiful young Spaniard, who showed herself an expert horsewoman, was greatly admired by all present and by the host in particular. Three weeks later, on the 2nd of December, the Empire was formally proclaimed, and during a series of fêtes at Compiègne, which lasted eleven days (19th to 30th December), the emperor became more and more fascinated. On New Year's Eve, at a ball at the Tuileries, Mdle de Montijo, who had necessarily excited much jealousy and hostility in the female world, had reason to complain that she had been insulted by the wife of an official personage. On hearing of it the emperor said to her, "Je vous vengera!"; and within three days he made a formal proposal of marriage. In a speech from the throne on the 2nd of January he formally announced his engagement, and justified what some people considered a mésalliance. "I am surprised," he said, "at a woman whom I love and respect to a woman unknown to me, with whom an alliance would have had advantages mixed with sacrifices." Of her whom he had chosen he ventured to make a prediction: "Endowed with all the qualities of the soul, she will be the ornament of the throne, and in the day of danger she will become one of its courageous supports." The marriage was celebrated with great pomp at Notre Dame on the 30th of January 1853. On the 19th of March 1856 the emperor gave birth to a son, who received the title of Prince Imperial. The emperor's prediction regarding her was not belied by events. By her beauty, elegance and charm of manner she contributed largely to the brilliancy of the imperial régime, and when the end came, she, as the official Empéatrice made by her enemies proved, one of the very few who showed calmness and courage in face of the great discomfiture to which the empire was brought at the regent during the absence of the emperor,—in 1859, 1865 and 1870,—and she was generally consulted on important questions. When the emperor vacillated between two lines of policy she generally urged him the bolder course; she deprecated everything tending to diminish the temporal power of the papacy, and she disapproved of the emperor's liberal policy at the close of his reign. On the collapse of the Empire she fled to England, and settled with the emperor and her son at Chislehurst. After the emperor's death she removed to Farnborough, where she built a mausoleum to his memory. In 1879 her son was killed in the Zulu War, and in the following year she visited the spot and brought back the body to be interred beside that of his father. At Farnborough and in a villa she built at Cap Martin on the Riviera, she continued to live in retirement, following closely the course of events, but abstaining from all interference in French politics.

**EUGÉNIX**, the name of four popes.

EUGÉNIX I., pope from 654 to 657. Elected on the banishment of Martin I. by the emperor Constans II., and at the height of the Monothelite crisis, he showed greater deference than his predecessor to the emperor's wishes, and made no public stand against the patriarchs of Constantinople. He, however, held no communication with them, being closely watched in this respect by Roman opinion.

EUGÉNIX II., pope, was a native of Rome, and was chosen to succeed Pascal I. in 824. His election did not take place without difficulty. Eugénix was the candidate of the nobles, and the clerical faction brought forward a competitor. But the monk Wala, the representative of the emperor Lothair, succeeded in arranging matters, and Eugénix was elected. Lothair, however, came to Rome in person, and took advantage of this opportunity to redress many abuses in the papal administration, to vest the election of the pope in the nobles, and to confirm the statute that no pope should be consecrated until his election had the approval of the emperor. A council which assembled at Rome during the reign of Eugenius passed several enactments for the restoration of church discipline, took measures for the foundation of schools and chapters, and decided against priests wearing a secular dress or engaging in secular occupations. Eugénix also adopted various provisions for the care of the poor and of widows and orphans.

EUGÉNIX III. (Bernardo Paganelli), pope from the 13th of February 1145 to the 8th of July 1153, a native of Pisa, was abbot of the Cistercian monastery of St. Anastasia at Rome when suddenly elected to succeed Lucius II. His friend and instructor, Bernard of Clairvaux, the most influential ecclesiastical of the time, remonstrated against his election on account of his "innocence and simplicity," but Bernard soon acquiesced and continued to be the mainstay of the papacy throughout Eugenius's pontificate. It was to Eugenius that Bernard addressed his famous work *De consideracione*. Immediately after his election, the Roman senators demanded the pope's renunciation of temporal power. He refused and fled to Farfa, where he was consecrated on the 17th of February. By treaty of December 1145 he recognized the republic under his suzerainty, substituted a papal prefect for the "patrician" and returned to Rome. The celebrated schismatic, Arnold of Brescia, however, put himself again at the head of the party opposed to the temporal power of the papacy, re-established the patriciate, and forced the pope to leave Rome. Eugenius had already, on hearing of the fall of Edessa, addressed a letter to Louis VII. of France (December 1145), announcing the Second Crusade and granting plenary indulgence under the usual conditions to those who would take the cross; and in January 1147 he journeyed to France to further preparations for the holy war and to seek aid in the constant feuds at Rome. After holding synods at Paris, Reims and Trier, he returned to Italy in June 1148 and took up
EUGENOL—EUHEMERUS

his residence at Viterbo. The following month he excommunicated Arnold of Brescia in a synod at Cremona, and thenceforth devoted most of his energies to the recovery of his see. As the result of negotiations between Frederick Barbarossa and the Romans, Eugenius was finally enabled to return to Rome in December 1152, but died in the following July. He was succeeded by Anastasius IV. Eugenius retained the stio virtues of monasticism throughout his stormy career, and was deeply revered for his personal character. His tomb in St Peter's acquired fame for miraculous cures, and he was pronounced blessed by Pius IX. in 1872.

EUGEN IV. (Gabriel Condemner), pope from the 3rd of March 1431 to the 23rd of February 1447, was born at Venice of a merchant family in 1383. He entered the Celestine order and came into prominence during the pontificate of his uncle, Gregory XII., by whom he was appointed bishop of Siena, papal treasurer, protonotary, cardinal-priest of St Marco e St Clemente, and later cardinal-priest of Sta Maria in Trastevere. His violent measures, as pope, against the relations of his predecessor, Martin V., at once involved him in a severe contest with the powerful house of Colonna. But by far the most important feature of Eugenius's pontificate was the great struggle between pope and council. On the 23rd of July 1431 his legate opened the council of Basel which had been convoked by Martin, but, distrustful of its purposes and moved by the small attendance, the pope issued a bull on the 18th of December 1431, dissolving the council and excommunicating a new one to meet in eleven months. The council refused to dissolve, renewed the revolutionary resolutions by which the council of Constance had been declared superior to the pope, and cited Eugenius to appear at Basel. A compromise was arranged by Sigismund, who had been crowned emperor at Rome on the 31st of May 1433, by which the pope recalled the bull of dissolution, and, reserving the rights of the Holy See, acknowledged the council as ecumenical (15th of December 1433). The establishment of an insurrection in public at Rome drove him into exile in May 1434, and, although the city was restored to obedience in the following October, he remained at Florence and Bologna. Meanwhile the struggle with the council broke out anew. Eugenius at length convened a rival council at Ferrara on the 8th of January 1438 and communicated the pretenses assembled at Basel. The result was that the latter formally deposed him as a heretic on the 25th of June 1439, and the following November elected the ambitious Amadeus VIII., duke of Savoy, as antipope under the title of Felix V. The conduct of France and Germany seemed to warrant this action, for Charles VII. had introduced the decrees of the council of Basel, with slight changes, into the former country through the Pragmatic Sanction of Bourges (7th of July 1438), and the diet of Mainz had deprived the pope of most of his rights in the latter country (26th of March 1439). At Florence, whither the council of Ferrara had been transferred on account of an outbreak of the plague, was effected in July 1439 a union with the Greeks, which, as the result of political necessities, proved but temporary. This union was followed by others of even less stability. Eugenius signed an agreement with the Armenians on the 22nd of November 1439, and with a part of the Jacobites in 1443; and in 1445 he received the Nestorians and Maronites. He did his best to stem the Turkish advance, pledging one-fifth of the papal income to the crusade which set out in 1443, but which met with overwhelming defeat. His rival, Felix V., meanwhile obtained small recognition, and the latter's ablest adviser, Aeneas Sylvius Piccolomini, made peace with Eugenius in 1442. The pope's recognition of the claims to Naples of King Alphonso of Aragon withdrawing the last important support from the council of Basel, and enabled him to make a victorious entry into Rome on the 28th of September 1443, after an exile of nearly ten years. His protests against the Pragmatic Sanction of Bourges were ineffectual. By means of the Concordat of the Princes, negotiated by Piccolomini with the electors in February 1447, the whole of Germany declared against the antipope. Although his pontificate had been so stormy and unhappy that he is said to have regretted on his death-bed that he ever left his monastery, nevertheless Eugenius's victory over the council of Basel and his efforts in behalf of church unity contributed greatly to break down the conciliar movement and restore the papacy to the position it had held before the Great Schism. Eugenius was dignified in demeanour, but inexperienced and vacillating in action and excitable in temper. Bitter in his hatred of heresy, he yet displayed great kindness to the poor. He laboured to reform the monastic orders, especially the Franciscan, and was never guilty of nepotism. Although a type of the austere monk in his private life, he was a sincere friend of art and learning, and in 1435 re-established the university at Florence at the 23rd of February 1447, and was succeeded by Nicholas V.

EUGENOL (allyl guaiacol, Eugenol), C\(_9\)H\(_8\)O\(_3\), an odorous aromatic principle; it is the chief constituent of oil of cloves, and occurs in many other essential oils. It can be synthetically prepared by the reduction of coniferyl alcohol, (HO)\((\text{CH}_2)\text{CH}_3\text{CH}_2\text{CH}_2\text{OH})\), in acetic acid, which occurs in combination with glucose in the glucoside coniferin, C\(_{13}\)H\(_{16}\)O\(_9\). It is a colourless oil boiling at 247°C., and having a spicy odour. On oxidation with potassium permanganate it gives hydrovanillin, vanillin, etc. Eugenol in acetic acid in acetic acid solution it is converted into carbon dioxide and acetic acid, whilst nitric acid oxidizes it to oxalic acid. By the action of alkalis it is converted into iso-eugenol, which on oxidation yields vanillin, the odorous principle of vanilla (q.v.). This transformation of allyl phenols into propenyl phenols is very general (see Ben., 1889, 22, p. 2747; 1890, 23, p. 862). Alkal fusion of eugenol gives protocatechuic acid. The amount of eugenol in oil of cloves can be estimated by acetylation, in presence of pyridine (A. Verley and Fr. Baehring, Ber., 1901, 34, p. 3359). Chavibetol, an isomer of eugenol, occurs in the eucalyptus oil obtained from Piper betle.

The structural relations are:

\end{align*}
\]

EUHEMERUS [EUHEMERUS, EUHEMERUS], Greek mythographer, born at Messana, in Sicily (others say at Chios, Tegos, or Messene in Peloponnesus), flourished about 300 b.c., and lived at the court of Cassander. He is chiefly known by his Sacred History (Ἱστορία Ἰδεῶν), a philosophic romance, based upon archaic inscriptions which he claimed to have found during his travels in various parts of Greece. He particularly relies upon an account of early history which he discovered on a golden pillar in a temple on the island of Panchaea when on a voyage round the coast of Arabia, undertaken at the request of Cassander, his friend and patron. There is apparently no doubt that this island is
EULENSPIEGEL—EULER

887

imaginary. In this work he for the first time systematized an old Oriental (perhaps Phoenician) method of interpreting the popular myths, asserting that the gods who formed the chief objects of popular worship had been originally heroes and conquerors, who had thus earned a claim to the veneration of their subjects. This system spread widely, and the early Christians particularly appealed to it as a confirmation of their belief that ancient mythology was merely an aggregate of fables of human invention. Euhemerus was a firm upholder of the Cyrenaic philosophy, and by many ancient writers he was regarded as an atheist. His work was translated by Ennius into Latin, but the work itself is lost, and of the translation only a few fragments, and these very short, have come down to us.

This rationalizing method of interpretation is known as Euhemerism. There is no doubt that it contains an element of truth: as among the Romans the gradual degradation of ancestors and the apotheosis of emperors were prominent features of religious development, so among primitive peoples it is possible to trace the evolution of family and tribal gods from great chiefs and warriors. All theories of religion which give prominence to ancestor worship and the cult of the dead are to a certain extent Euhemeristic. But as the sole explanation of the origin of religion is not acceptable, it is only a religious theory. It had, however, considerable vogue in France. In the 18th century the abbé Bandier, in his Mythologie et la faible explication de l’histoire, was frankly Euhemeristic; other leading Euhemerists were Clairv, Sainte-Croix, Raoul Rochette, Em. Hoffmann and to a great extent Herbert Spencer.

See Raymond de Bock, Éuhémère, son livre et sa doctrine (Mons, 1856); G. N. Nemethy, Euhemerismus (Budapest, 1856); Gans, Questiones Euhemerianae (Kempen, 1860); Otto Sierk, De Euhemer (1866); Susemihl, Geschichte der griechischen Literatur in der Alexandrinerzeit, vol. i. (Leipzig, 1891); and works on comparative religion and mythology.

EULENSPIEGEL [ULENSPIEGEL], TILL, the name of a German folk-hero, and the title of a popular German chapbook on the subject, of the beginning of the 16th century. The oldest existing German text of the book was printed at Strassburg in 1515 (Ein kurzeuzig lesen von Dyf Vienspiel gebaren vus dem Land zu Brunswicke), and again in 1539. This is not in the original dialect, which was undoubtedly Low Saxon, but in High German, the translation having been formerly ascribed—but on insufficient evidence—to the Catholic satirist Thomas Murner. Its hero, Till Eulenspiegel or Ulenspiegel, the son of a peasant, was born at Kneitingen in Brunswick, at the end of the 15th or at the beginning of the 16th century. He died, according to tradition, at Mölln near Lübeck in 1530. The jests and practical jokes ascribed to him were collected—if we may believe a statement in a 15th-century Life of him—by 1483; but in any case the edition of 1515 was not even the oldest High German edition. Eulenspiegel's activities were associated almost exclusively with the Lower German area extending from Magdeburg to Hanover, and from Lüneburg to the Harz Mountains. He is the simple peasant who loves to exercise his wit and dexterity in the tradepeoples of the towns, above all, on the innkeepers; but priests, noblemen, even princes, are also among his victims. His victories are often pointless, more often brutal; he sometimes, without hesitation, to the amusement and oblivion of the finer, sharper wit which the humanists and the Italians introduced into the anecdote, he has little or nothing. His jests are coarsely practical, and his satire takes extreme forms. In fact, this chapbook might be described as the retaliation of the peasant on the townsman who in the 15th and 16th centuries had begun to look down upon the country boor as a natural inferior.

In spirit if not in fact, however, the character, Eulenspiegel, was extremely popular in other lands, and, at an early date, was translated into Dutch, French, English, Latin, Danish, Swedish, Bohemian and Polish. In English, "Howelglas" (Scottish, Holliglas) was long a familiar figure; his jests were rapidly adapted to English conditions, and appropriated in the collections associated with Robin Goodfellow, Scogans and others. Ben Johnson referred to him as "Howelglas" and "Ulenspiegel" in his Masque of the Fortunate Isles, Poetaster, Alchemist and Sad Shepherd, and a verse by Taylor the "water poet" would seem to imply that the "Owlgisse" was a familiar popular type. Till Eulenspiegel's "merry pranks" have been made the subject of a well-known orchestral symphony by Richard Strauss. In France, it may be noted, the name has given rise to a modern "Till Eulenspiegel," the street-barker. The Strassburg edition of 1515 (British Museum) has been reprinted by H. Knust in the Neudrucke deutscher Literaturwerke des 16. und 17. Jahrh. No. 55-56 (1885); that of 1519 by J. M. Lappegem, De Thomas Merners Uienkegle (1843). W. Sonnleitner and A. Anfänge des Prosaromans in Deutschland, in Quellen und Forschungen, vol. xxii, 1877, pp. 28 ff. and 78 f.) has shown that there must have been an earlier High German edition. See also Die Niederdeutsche Jahrbüch, xix. (1894), pp. 1 ff. Further editions appeared at Cologne, printed by Servais Krufter, undated (reproduced in photo-lithography from the two imperfect copies in Berlin and Vienna, 1863); Erfurt, 1533, 1537-1539 and 1545; Cologne, 1539; Strassburg, 1539; Augsburg, 1540 and 1541; Strassburg, 1543; Frankfort on the Main, 1545; Strassburg, 1551; Cologne, 1554, ed. Johann Fiche, published an adaption in 1554, Der Eulenspiegel Reimmedweis (Strassburg, 1571), K. Simrock a modernization in 1684 (2nd ed., 1787); there is also one by J. C. Pannier in Reclam's Universalbibliothek (1883). The earliest translation was that into Dutch, printed by Hoochstraten at Antwerp (Royal Lib., Copenhagen); it is undated, but may have appeared as early as 1512. See facsimile reprint by M. Nijhoff (the Hague, 1890). This was the basis for the French versions of 1582 (fully printed 1592), den omin, de ses œvres et merveilëuses aventures par luy faiées... nonnuellement translat et corrig de Flamain en Francois (Paris, 1582). A reprint, edited by P. Latz (1882), is still in print. Upwards of twenty French editions down to the beginning of the 16th century. The latest translation is that by J. C. Debekker (Brussels, 1825 and 1840). Eulenspiegel, a reconstruction by K. R. H. Mackenzie in 1886 (2nd ed., 1890). On Eulenspiegel, in English, see especially C. H. Herford, Studies in the Literary Relations of England and Germany in the Sixteenth Century (1888), pp. 424 ff., and F. Brie's work already referred to (J. C. R.).

EULER, LEONHARD (1707-1783), Swiss mathematician, was born at Basel on the 15th of April 1707, his father Paul Euler, who had considerable attainments as a mathematician, being Calvinistic pastor of the neighbouring village of Riechen. After receiving preliminary instructions in mathematics from his father, he was sent to the university of Basel, where geometry soon became his favourite study. His mathematical genius gained for him a high place among the esteem of Jean Bernoulli, who at that time one of the most noted mathematicians in Europe as well as of his sons Daniel and Nicolas Bernoulli. Having taken his degree as master of arts in 1723, Euler applied himself, at his father's desire, to the study of theology and the Oriental languages with the view of entering the church, but, with his father's consent, he soon returned to geometry as his principal pursuit. At the same time, by the advice of the younger Bernoulli, who had removed to St Petersburg in 1725, he applied himself to the study of physiology, to which he made a happy application of his mathematical knowledge; and he also attended the medical lectures at Basel. While he was engaged in physiological researches, he composed a dissertation on the nature and propagation of sound, and an answer to a prize question concerning the mastig of ships, to which the French Academy of Sciences adjudged the second rank in the year 1727.

In 1727, on the invitation of Catherine I., Euler took up his residence in St Petersburg and became a member of the Academy of Sciences. In 1730 he became professor of physics, and in 1733 he succeeded Daniel Bernoulli in the chair of mathematics. At the commencement of his new career he enriched the academical collection with many memoirs, which excited a noble emulation between him and the Bernoullis, though this did not in any way affect their friendship. It was at this time that he carried the integral calculus to a higher degree of perfection, invented the calculation of sines, reduced analytical operations
to a greater simplicity, and threw new light on nearly all parts of pure mathematics. In 1733 a problem proposed by the academy, for the solution of which several eminent mathematicians had demanded almost thirty years, was solved by Euler in three days, but the effort threw him into a fever which endangered his life and deprived him of the use of his right eye. The Academy of Sciences at Paris in 1738 adjudged the prize to his memoir on the nature and properties of fire, and in 1740 his treatise on the tides shared the prize with those of Colin Maclaurin and Daniel Bernoulli—a higher honour than if he had carried it away from inferior rivals.

In 1741 Euler accepted the invitation of Frederick the Great to Berlin, where he was made a member of the Academy of Sciences and professor of mathematics. He enriched the last volume of the Mémoires or Miscellaneous of Berlin with five memoirs, and these were followed, with an astonishing rapidity, by a great number of important researches, which are scattered throughout the annual memoirs of the Prussian Academy. At the same time he continued his philosophical contributions to the academy of St Petersburg, which granted him a pension in 1742. The respect in which he was held by the Russians was strikingly shown in 1760, when a farm he occupied near Charlottenburg happened to be pillaged by the invading Russian army. On its being ascertained that the farm belonged to Euler, the general immediately ordered compensation to be paid, and the empress Elizabeth sent an additional sum of four thousand crowns.

In 1766 Euler with difficulty obtained permission from the king of Prussia to return to St Petersburg, to which he had been originally invited by Catherine II. Soon after his return to St Petersburg a cataract formed in his left eye, which ultimately deprived him almost entirely of sight. It was in these circumstances that he dictated to his servant, a tailor's apprentice, who was absolutely devoid of mathematical knowledge, his Anleitung zur Algebra (1770), a work which, though purely elementary, displays the mathematical genius of its author, and is still reckoned one of the best works of its class. Another task to which he set himself immediately after his return to St Petersburg was the preparation of his Lettres à une princesse d'Allemagne sur quelques sujets de physique et de philosophie (3 vols., 1768–1772). They were written at the request of the princess of Anhalt-Dessau, and contain an admirably clear exposition of the principal laws of mechanics, optics, acoustics and physical astronomy. Theory, however, is frequently unsoundly applied in them, as it is to be observed generally that Euler's strength lay rather in pure than in applied mathematics.

In 1755 Euler had been elected a foreign member of the Academy of Sciences at Paris, and some time afterwards the academical prize was adjudged to three of his memoirs Concerning the Inequalities in the Motions of the Planets. The two prize questions proposed by the same academy for 1770 and 1772 were designed to obtain a more perfect theory of the moon's motion. Euler, assisted by his eldest son Johan Albert, was a competitor for these prizes, and obtained both. In the second memoir he reserved for further consideration several inequalities of the moon's motion, which he could not determine in his first theory on account of the complicated calculations in which the method he then employed had engaged him. He afterwards revised his whole theory with the assistance of his son and W. L. Krafft and A. J. Lexell, and pursued his researches until he had constructed the new table of differences which appeared in his Theoria motuum lunae (1772). Instead of confining himself, as before, to the fruitless integration of three differential equations of the second degree, which are furnished by mathematical principles, he reduced them to the three co-ordinates which determine the place of the moon; and he divided into classes all the inequalities of that planet, as far as they depend either on the elongation of the sun and moon, or upon the eccentricity, or the parallax, or the inclination of the lunar orbit. The inherent difficulties of this task were immensely enhanced by the fact that Euler was virtually blind, and had to carry all the elaborate computations it involved in his memory. A further difficulty arose from the burning of his house and the destruction of the greater part of his property in 1771. His manuscripts were fortunately preserved. His own life was only saved by the courage of a neighbour, Peter Grizimon, who carried him out of the burning house.

Some time after this an operation restored Euler's sight; but a too harsh use of the recovered faculty, along with some carelessness on the part of the surgeons, brought about a relapse. With the assistance of his sons, and of Kraft and Lexell, however, he continued his labours, neither the loss of his sight nor the infirmities of an advanced age being sufficient to check his activity. The academy engaged to furnish the Academy of St Petersburg, with as many memoirs as would be sufficient to complete its Acta for twenty years after his death, he in seven years transmitted to the academy above seventy memoirs, and left above two hundred more, which were revised and completed by another hand.

Euler's knowledge was more general than might have been expected in one who had pursued with such unremittent ardour mathematics and astronomy as his favourite studies. He had made very considerable progress in medical, botanical and chemical science, and he was an excellent classical scholar, and extensively read in general literature. He was much indebted to an uncommon memory, which seemed to retain every idea that was conveyed to it, either from reading or meditation. He could repeat the Aeneid of Virgil from the beginning to the end without hesitation, and indicate the first and last line of every page of the edition which he used. Euler's constitution was unusually vigorous, and his general health was always good. He was enabled to continue his labours to the very close of his life. His last subject of investigation was the motion of balloons, and the last subject on which he conversed was the newly discovered planet Herschel (Uranus). He died of apoplexy on the 18th of September 1783, whilst he was amusing himself at tea with one of his grandchildren.

Euler's genius was great and his industry still greater. His works, if printed as he wrote them, would occupy from 60 to 80 quarto volumes. He was simple and upright in his character, and had a strong religious faith. He was twice married, his second wife being a half-sister of his first, and he had a numerous family, several of whom attained to distinction. His Böge was written for the French Academy by the marquis de Condorcet, and an account of his life, with a list of his works, was written by Von Fuss, the secretary to the Imperial Academy of St Petersburg.

EUMENES—EUMENIUS

EUMENES, the name of two rulers of Pergamum.

Pergamum I. succeeded his uncle Philadelphus in 263 B.C. The only important event in his reign was his victory near Sardis over Antiocbus Soter, which enabled him to secure possession of the districts round his capital. (See Pergamum.)

2. EUMENES II., son of Attalus I., was king of Pergamum from 197-159 B.C. During the greater part of his reign he was a loyal ally of the Romans, who bestowed upon him signal marks of favour. He materially contributed to the defeat of Antiocbus of Syria at the battle of Magnesia (190), and as a reward for his services the Thracian Chersonese and all Antiocbus’s possessions as far as the Taurus were bestowed upon him, including a protectorate of such Greek cities as had not been declared free. In his quarrels with his neighbours the Romans intervened on his behalf, and on the occasion of his visit to Rome to complain of the conduct of Perseus, king of Macedon, he was received with the greatest distinction. On his return journey he narrowly escaped assassination by the emissaries of Perseus. Although he supported the Romans in the war against Macedon, Polybios said he played so little energy and interest (even recalling his auxiliaries) that he was suspected of intriguing with the enemy. According to Polybios there was some foundation for the suspicion, but Eumenes declared that he had merely been negotiating for an exchange of prisoners. Nothing, however, came of these negotiations, whatever may have been their real object; and Eumenes, in order to avert suspicion, sent his congratulations to Rome by his sons after the defeat of Perseus (168). Eumenes was received courteously but coldly; and Eumenes in alarm set out to visit Rome in person, but on his arrival at Brundusium was ordered to leave Italy at once. Eumenes never regained the good graces of the Romans, who showed especial favour to Attalus on his second visit to Rome, probably with the object of setting him against Eumenes; but the ties of kinship proved too strong. The last years of his reign were disturbed by renewed hostilities against Prusias of Bithynia and the Celts of Galatia; and probably only his death prevented a war with Rome. Eumenes, although physically weak, was a shrewd and vigorous ruler and politician, who raised his little state from insignificance to a powerful monarchy. During his reign Pergamum became a flourishing city, where men of learning were always welcome, among them Crates of Mallus, the founder of the Pergamum school of criticism. Eumenes adorned the city with splendid buildings, amongst them the great altar with the frieze representing the Battle of the Giants; but the greatest monument of his liberality was the foundation of the library, which was second only to that of Alexandria.

See Livy xxxix. 51, xlii. 11-16; Polybios xxx. xxii.; Appian, Syracusa; Livy, Epit. 46; Cornelius Nepos, Hannibal, 10; A. G. van Cappelle, Commentario de rebus et antiquitate Pergamensis (Amsterdam, 1841). For the altar of Zeus, see Pergamum; for treaty with Creton cities (183 B.C.) see Monumenti antichi, xvii. 177.

EUMENES (c. 360-316 B.C.), Macedonian general, was a native of Cardia in the Thracian Chersonesus. At a very early age he was employed as private secretary by Philip II. of Macedon, and on the death of that prince, by Alexander, whom he accompanied into Asia. In the division of the empire on Alexander’s death, Cappadocia was assigned to Eumenes; but as they were not yet subdued, Leonnatus and Antigonus were charged by Perdicas to put him in possession. Antigonus, however, disregarded the order, and Leonnatus in vain attempted to induce Eumenes to accompany him to Europe and share in his far-reaching designs. Eumenes joined Perdicas, who installed him in Cappadocia. When Craterus and Antipater, having reduced Greece, determined to pass into Asia and overthrow the power of Perdicas, their first blow was aimed at Cappadocia. Craterus and Neoptolemus, satrap of Armenia, were completely defeated by Eumenes (321); Neoptolemus was killed, and Craterus died of his wounds. After the murder of Perdicas in Egypt by his own soldiers, the Macedonian generals condemned Eumenes to death, and charged Antipater and Antigonus with the execution of their order. Eumenes, being defeated through the treachery of one of his officers from Cappadocia, a strong fortress on the confines of Cappadocia and Lycaonia, where he defended himself for more than a year. The death of Antipater (319) produced complications. He left the regency to his friend Polyperchon over the head of his son Cassander, who entered into an alliance with Antigonus and Ptolemy against Polyperchon, supported by Eumenes, who, having escaped from Nors, was threatening Syria and Phœnicia. In 316 Antigonus marched against him, and Eumenes with difficulty made his way to join the satraps of the provinces beyond the Tigris. After two indecisive battles in Iran, Eumenes was betrayed by his own soldiers to Antigonus and put to death. He was an able soldier, who did his utmost to maintain the unity of Alexander’s empire in Asia; but his efforts were frustrated by the generals and satraps, who hated and despised the “secretary” and “foreigner.”

See Plutarch, Eumenes; Cornelius Nepos, Eumenes; Dio, Sic. xviii., xix.; Arrian, Anabasis, vii., Quintus Curtius x. 4. 40; Justin xiii. 8; A. Veit, Eumenes von Karthia. Ein Beitrag zur Geschichte der Diadochenzeit (Münster i.W., 1907). Also MACEDONIAN EMPIRE.

EUMENIDES (from Gr. έμενηδῆς, kindly; -εδ, well, and πίος, disposition), the “kindly ones,” a euphemism for the Furies or Erinys (q.v.). They give their name to a famous play by Aeschylus (q.v.), written in glorification of the old religion and the imperial government of Athens, in opposition to the new democracy of the Periclean period.

EUMENIUS (c. a.d. 960-314), one of the Roman panegyrists, was born at Augustodunum (Autun) in Gallia Lugdunensis. He was of Greek descent; his grandfather, who had migrated from Athens to Rome, finally settled at Autun as a teacher of rhetoric. Eumenius probably took his place, for it was from Autun that he went to be magister memoriae (private secretary) to Constantius Chlorus, whom he accompanied on several of his campaigns. In 296 Chlorus determined to restore the famous schools (scholae Maenianae) of Autun, which had been greatly damaged by the inroads of the Bagaudae (peasant banditti), and appointed Eumenius to the management of them, allowing him to retain his offices at court and doubling his salary. Eumenius generously gave up a considerable portion of his emoluments to the improvement of the schools. There is no doubt that Eumenius was a heathen, not even a nominal follower of Christianity, like Ausonius and other writers from Gaul. Nothing is known of his later years; but he must have lived at least till 311, if the Gratianorum Actio to Constantine is by him. Of the twelve discourses included in the collection of Panegyrici Latini (ed. E. Bährsen, 1874), the following are probably by Eumenius: (1) pro restitutoribus (or instauratoribus) scholae, delivered (297) in the forum at Autun before the governor of the province. Its chief object is to set forth the steps necessary to restore the schools to their former state of glory, and the author lays stress upon the fact that he intends to assist the good work out of his own pocket. (2) An address (297) to the Caesar Constantius Chlorus, congratulating him on his victories over Allectus and Carausius in Britain, and containing information of some value as to the British methods of fighting. (3) A panegyric on Constantine (310). (4) An address of thanks (311) from the inhabitants of Autun (whose name had been changed from Augustodunum to Flavia) to Constantine for the remission of taxes and other benefits. (5) A festal address (307) on the marriage of Constantine and Fausta, the daughter of Maximian. All these speeches, with the exception of (1), were delivered at Augusta Treverorum (Trèves), whose birthday is celebrated in (3). Eumenius is far the best of the orators of his time, and superior to the majority of the writers of imperial panegyric. He shows greater self-restraint and moderation in his language, which is simple and pure, and on the whole is free from the gross flattery which characterizes such productions. This fault is most conspicuous in (3), which led Heyne (Opuscula, vi. 80) to deny the authorship of Eumenius on the ground that it was unworthy of him.
EUMOLPUS—EUNUCH

There are treatises on Eumenius by B. Kilian (Würzburg, 1869), S. Brandt (Freiburg im Breisgau, 1882), and H. Sachs (Halle, 1885); see also Gaspar Boissier, "Les Rhetètes gaulois du IVe siècle," in Journal des savants (1864).

EUMOLPUS ("singer sweet"), in Greek mythology, son of Poseidon and Chione, the daughter of Boreas, legendary priest, poet and warrior. He finally settled in Thrace, where he became king. During a war between the Eleusinians and Athenians under Erechtheus, he went to the assistance of the former, who on a previous occasion had shown him hospitality, but was slain with his two sons, Phorbas and Immaradus. According to another tradition, Erechtheus and Immaradus lost their lives; the Eleusinians then submitted to Athens on condition that they alone should celebrate the mysteries, and that Eumolpus and the daughters of Celeus should perform the sacrifices. It is asserted by others that Eumolpus with a colony of Thracians laid claim to Attica as having belonged to his father Poseidon (Isocrates, Panath. 103). The Eleusinian mysteries were generally considered to have been founded by Eumolpus, the first priest of Demeter, but, according to some, by Eumolpus Musaeus. Eumolpus the Thracian being the father of Keryx, the ancestor of the priestly family of the Kerykes. As priest, Eumolpus purifies Hercules from the murder of the Centaurs, as musician, he instructs him (as well as Linus and Orpheus) in playing the lyre, and is the reputed inventor of vocal accompaniments to the flute. Suidas reckons him one of the early poets and a writer of hymns of consecration, and Diodorus Siculus quotes a line from a Dionysiac hymn attributed to Eumolpus. He is also said to have been the first priest of Dionysus to have introduced the cultivation of the vine and fruit trees (Pliny, Nat. Hist. vii. 190). His grave was shown at Athens and Eleusis. His descendants, called Eumolpidae, together with the Kerykes, were the hereditary guardians of the mysteries (q.v.).

See Apollodorus ii. 5. iii. 15; Pausanias i. 38. 2; Hyginus, Fab. 273; Isocrates, Panath. 103; Pseudo-Apollodorus vii. p. 332; Diod. Sic. i. 11; article "Eumolpidia," by A. Hild in Daremberg and Saglio's Dictionnaire des antiquités.

EUNAPIUS, Greek sophist and historian, was born at Sardis, A.D. 347. In his native city he studied under his relative the sophist Chrysaantas, and while still a youth went to Athens, where he became a favourite pupil of Proserenus the rhetorician. He possessed a considerable knowledge of medicine. In his later years he seems to have resided at Athens, teaching rhetoric. Initiated into the Eleusinian mysteries, he was admitted into the college of the Eumolpidae and became hierophant. There is evidence that he was still living in the reign of the younger Theodosius (408–450). Eunapius was the author of two works, one entitled Lives of the Sophists (Βίοι φύλοφοσ και σοφιστῶν), and the other consisting of a continuation of the history of Dionysius the former writer. All that is still extant of the former work only excerpts remain, but the facts are largely incorporated in the work of Zosimus. It embraced the history of events from A.D. 270–404. The Lives of the Sophists, which deals chiefly with the contemporaries of the author, is valuable as the only source for the history of the neo-Platonism of that period. The style of both works is bad, and they are marked by a spirit of bitter hostility to Christianity. Photius (cod. 77) had before him a new edition of the history in which the passages most offensive to the Christians were omitted.

EUNOMIUS (d. c. 393), one of the leaders of the extreme or "anomoean" Arians, who are sometimes accordingly called Eunomians, was born at Dacora in Cappadocia early in the 4th century. He studied theology at Alexandria under Aetius, and afterwards came under the influence of Eudoxius of Antioch, where he was ordained deacon. On the recommendation of Eudoxius he was appointed bishop of Cyzicus in 360. Here his free utterance of extreme Arian views led to popular complaints, and Eudoxius was compelled, by command of the emperor, Constantius II., to depose him from the bishopric within a year of his elevation to it. During the reigns of Julian and Jovian, Eunomius resided in Constantinople in close intercourse with Aetius, consolidating an heretical party and consecrating schismatical bishops. He then went to live at Chalcedon, whence in 367 he was banished to Mauretania for harbouring the rebel Procopius. He was recalled, however, before he reached his destination. In 383 the emperor Theodosius, who had demanded a declaration of faith from all party leaders, punished Eunomius for continuing to teach his distinctive doctrines, by banishing him to Halmyris in Moesia. He afterwards resided at Chalcedon and at Caesarea in Cappadocia, from which he was expelled by the inhabitants for writing against their bishop Basil. His last days were spent at Dacora his birthplace, where he died about 393. His writings were held in high reputation by his party, and their influence was so much dreaded by the orthodox, that more than one imperial edict was issued for their destruction (Cod. Theod. t. 21. 34). Consequently his commentary on the epistle to the Romans, mentioned by the historian Socrates, and his epistles, mentioned by Philostorgius and Photius, are no longer extant. His first apologetical work (Ἀποκαταστάσις), written probably about 360 or 365, has been entirely recovered from the celebrated refutation of it by Basil, and may be found in J. A. Fabricius, Bibl. Gr. viii. pp. 262–305. A second apology, written before 379 (_written by self_ Ἀποκατάστασις ἐν τῷ ἐν Βασίλε, only in the editions given in a refutation by Gregory of Nyssa. The exposition of faith (Ἐν οἷς ἔσαρθμα), called forth by the demand of Theodosius, is still extant, and has been edited by Valesius in his notes to Socrates, and by Ch. H. G. Rettberg in his Marcelliano.

The teaching of the Anomoean school, led by Aetius and Eunomius, starting from the conception of God as δὲ ἄγνωστος, argued that between the ἐγκύρως and ἄγνωστος there could be no essential, but at best only a moral, resemblance. "As the Unbegotten, God is an absolutely simple being; an notion of generation would involve a contradiction of His essence by introducing duality into the Godhead." According to Socrates (v. 24), Eunomius carried his views to a practical issue by altering the baptismal formula. Instead of baptizing in the name of the Trinity, he baptized in the name of the Creator and into the death of Christ. This alteration was regarded by the orthodox as so serious that Eunomians on returning to the church were repudiated, though the Arians were not. The Eunomian heresy was formally condemned by the council of Constantinople in 381. The sect maintained a separate existence for some time, but gradually fell away owing to internal divisions.

See C. R. W. Klose, Geschichte und Lehre des Eunomius (Kiel, 1853); F. Loofs in Hauck-Hertzog, Realencyk. für prot. Theol.; and Eunomius contains an English translation of the first apology. See also Aetius.

EUNUCH (Gr. ἐνοῦχος), an emancipated male. From remote antiquity among the Orientals, as also at a later period in Greece, eunuchs were employed to take charge of the women, or generally as chamberlains—whence the name of τῆς ἐνούχος ἱππέως, i.e. those who have charge of the bed-chamber. Their confidential position in the harems of princes frequently enabled them to exercise an important influence over their royal masters, and even to raise themselves to stations of great trust and power (see Harem). Hence the term eunuch came to be applied in Egypt to any court officer, whether a castratus or not. The common idea that eunuchs are necessarily deficient in courage and in intellectual vigour is amply refuted by history. We are told, for example, by Herodotus that in Persia they were especially prized for their fidelity; and they were frequently promoted to the highest offices. Nurses, the famous general under Justinian, was a eunuch, as was also Hermias, governor of Atarnea in Asia. Hence the great Aristotle offered sacrifice besides celebrating the praises of his patron and friend in a poem (still extant) addressed to Virtue (see Lucian's dialogue entitled Eunuchus). The capacity of eunuchs for public affairs is strikingly illustrated by the histories of Persia, India and China; and considerable power was exercised by the eunuchs under the later Roman emperors. The hideous trade of castrating boys to be sold as eunuchs for Moslem harems has continued
to modern times, the principal district whence they are taken is the northwestern Africa (Bagirmi, &c.). As the larger proportions of children die after the operation (generally too soon), owing to unskilful surgery, such as recover fetch at least three or four times the ordinary price of slaves. Even more vile, as being practised by a civilized European nation, was the Italian practice of castrating boys to prevent the natural development of the voice, in order to train them as adult soprano singers, such as might formerly be heard in the Sistine chapel. Though such mutilation is a crime punishable with severity, the supply of "soprani" never failed so long as their musical powers were in demand in high quarters. Driven long ago from the Italian stage by public opinion, they remained the musical glory and moral shame of the papal choir till the accession of Pope Leo XIII., one of whose first acts was to get rid of them. Mention must here also be made of the class of voluntary eunuchs, who have emasculated themselves, or caused the operation to be performed on them, for the avoidance of sexual sin or temptation. This unnatural development of asceticism appears in early Christian ages, its votaries acting on the texts Matt. xix. 12, v. 28-30.

Origen's case is the most celebrated example, and by the 3rd century there had arisen a sect of eunuchs, of whom Augustine says (De haeres. c. 37), "Valesii et seipsum castrant et hospites suos, hoc modo existimantur Deose debere servire" (see Neander, History of Chr. Church, vol. ii. p. 462; Bingham, Antiq. Chr. Church, book iv. chap. 3.) Such practices have been always opposed by the natural body of the church, and Demetrius in his church council have not even now ceased. A secret sect of the kind exists in Russia, whose practice of castration is expressed in their name of Skopsi.

EUNUCH FLUTE, or Onion Flute (Fr. flûte enonque, flûte à l'ionion, milîlon; Ger. Zwiebelflûte), a wind instrument in use during the 16th and 17th centuries, producing music akin to the corn-music of the nursery, and still manufactured as a toy (mîliôn). The onion flute consists of a woollen tube with holes cut out slightly to form a bell. The upper end of the tube is closed by means of a very fine membrane similar to an onion skin stretched across the aperture like the vellum of a drum. The mouthpiece, a simple round hole, is pierced a couple of inches below the membrane; into this hole the performer sings, his voice setting up vibrations in the membrane, which thus intensifies the sound and changes its timbre to a bleating quality. A movable cap fits over the membrane to protect it. Mersenne has given a drawing of the onion flute together with a description; he states that the vibrations of the membrane improve the sound of the voice, and by reflecting it, give it an added charm. There were concerts of these flutes in four or five parts in France, adds Mersenne, and they had the advantage over other kinds of reproducing more nearly the sound of the voice.

EUNUCH, in botany, a genus of deciduous or evergreen shrubs or small trees, widely distributed in the north temperate zone, and represented in Britain by E. ehupeus, the spindle tree, so called from its hard tough wood being formerly used for spindles. It is a shrub or small tree growing in copses or hedges, with a grey smooth bark, four-angled green twigs, opposite leaves and loose clusters of small greenish-white flowers. The ripe fruit is a pale crimson colour and splits into four lobes exposing the bright orange-coloured seed. E. japonicus is a hardy evergreen shrub, often variegated and well known in gardens. The Greek name éunouos, of good name, is probably a euphemism; the flowering was said to foretell plague.

EUPALINUS, of Megara, a Greek architect, who constructed for the tyrant Polycrates of Samos a remarkable tunnel to bring water to the city, passing under a hill. This aqueduct still exists, and is one of the most remarkable constructions in Greece (see AQUEDUCT: Greek).

EUPATORIA (Russ. Eupatoria; also known as Kastan and to the Turks as Geler), a seaport of Russia, in the Government of Taurida, on the W. coast of the Crimea, 20 m. N.W. of Simferopol, on a sandy promontory on the north of Kalamita Bay, in 44° 12' N. and 35° 40' E. Pop. (1871) 8294; (1897) 17,015. This number

Includes many Jews, the Karaites sect having there their principal synagogue. Here too resides the spiritual head (gabhan) of the sect. Of its numerous ecclesiastical buildings three are of interest—the synagogue of the Karaites Jews; one of the mosques, which has fourteen cupolas and is built (1552) after the plan of St Sophia in Constantinople; and the Greek Catholic cathedral (1898). The port or rather roadstead has a sandy bottom, and is exposed to violent storms from the N.E. The trade is principally in cereals, skins, cow-hair, felt, tallow and salt. Eupatoria has some repute as a sea-bathing resort.

According to some authorities it was near this spot that a military post, Eupatorioum, was established in the 1st century A.D. by Diophantus, the general of Mitridates the Great, king of Pontus. Towards the end of the 15th century the Turks built the fortress of Gzelveh on the present site, and it became the capital of a khanate. It was occupied by the Russians under Marshal Münnich in 1736, and in 1771 by Prince Dolgorukov. Its annexation to Russia took place in 1783. In 1854 the Anglo-French troops were landed in the neighbourhood of Eupatoria, and in February 1855 the town was occupied by the Turkish forces.

EUPATRIDEAE (Gr. εὖ, well; πατρός, father, i.e. "Sons of noble fathers"), the ancient nobility of Attica. Tradition ascribes to Theseus, whom it also regards as the author of the union (synoecism) of Attica round Athens as a political centre, the division of the Attic population into three classes, Eupatridae, and Demiurgi, and geographers mention as characteristic of the Eupatridae that they are the autochthonous population, the dwellers in the city, the descendants of the royal stock. It is probable that after the time of the synoecism the nobles who had hitherto governed the various independent communities were obliged to reside in Athens, now the seat of government; and at the beginning of Athenian history the noble class form a class which has the monopoly of political privilege. It is possible that in very early times the Eupatridae were the only citizens of Athens; for the evidence suggests that they alone belonged to the phratries, and the division into phratries must have covered the whole citizen body. It is indeed just possible that the term may originally have signified "true member of a clan," since membership of a phratry was a characteristic of each clan (γάθος). It is not probable that the Eupatrid families were all autochthonous, even in the loose sense of that term. Some had no doubt immigrated to Attica when the earlier long period was settled there. Towards the close of the century immigrants with older inhabitants have been detected in the combination of Zeus Herkeios with Apollo Patroos as the ancient gods of the phratry.

The exact relation of the Eupatridae to the other two classes has been a matter of dispute. It seems probable that the Eupatridae were the governing class, the only recognized nobility, the Geomori the country inhabitants of all ranks, and the Demiurgi the commercial and artisan population. The division attributed to Theseus is always spoken of by ancient authorities as a division of the entire population; but Busolt has recently maintained the view that the three classes represent three elements in the Attic nobility, namely, the city nobility, the landed nobility and the commercial nobility, and exclude altogether the mass of the population. At any rate it seems certain from the little we know of the early constitutional history of Athens, that the Eupatridae represent the only nobility that had any political recognition in early times. The political history of the Eupatridae is that of a gradual curtailment of privilege. They were at the height of their power in the period during the limitation of the monarchy. They alone held the two offices, those of polemarch and archon, which were instituted during the 8th century B.C. to restrict the powers of the kings. In 712 B.C. the office of king (βασιλεύς) was itself thrown open to all Eupatridae. They thus had the entire control of the administration, and were the sole dispensers of justice in the state. At this latter privilege, which perhaps formed the strongest bulwark of the authority of the Eupatridae, a severe blow was struck (c. 621 B.C.) by the publication of a criminal
EUPHEN—EUPHORBIACEAE

code by Draco (q.e.), which was followed by the more detailed and permanent code of Solon (c. 504 B.C.), who further threw open the highest offices to any citizen possessed of a certain amount of landed property (see SOLON), thus putting the claims of the Eupatriae to political influence on a level with those of the citizens of all classes. The most highly coveted office at this time was not that of Badek, which belonged to the rex sacrorum in Rome, had been stripped of all save its religious authority, but that of the Archon; soon after the legislation of Solon repeated struggles for this office between the Eupatriae and leading members of the other two classes resulted in a temporary change. Ten archons were appointed, five of whom were to be Eupatriae, three Agroeci (i.e. Geomori), and two Demiurgi (Arist. Ath. Pol. xii. 2). This arrangement, though short-lived, is significant of the decay of the political influence of the Eupatriae, and it is not likely that they recovered, even in practice, any real control of the government. By the middle of the 6th century the political influence of birth was at an end.

The name Eupatriae survived in historical times, but the Eupatriae were then excluded from the cult of the "Semaenae" at Athens, and also held the hereditary office of "exponent of the law" (exarchos) in connection with the purification from the guilt of murder. The combination of these two characteristics suggests some connexion with the legend of Orestes. Again, Isocrates (xvi. 25) says of Alcibiades that his grandfather was a Eupatrid and his grandmother an Alcmeneid, which suggests that in the 5th century the Eupatriae were a single clan, like the Alcmeneids, and that the name had acquired a new significance. A pursuit of these two suggestions has established the probability that this "Eupatrid" clan traced its origin to Orestes, and derived its name from the hero, who was above all a benefactor of his father. The word will well bear this sense in the two passages in which Sophocles (Electra, 162, 859) applies it to Orestes; and it is likely enough that after the disappearance of the old Eupatriae as a political corporate, the name was adopted in a different sense, but not without a claim to the distinction inherent in the older sense, by one of the oldest of the clans.

(E. M. CL.)

EUPEN (Fr. Nain), a town of Germany, in the Prussian Rhine province, in a beautiful valley at the confluence of the Halle and Vesdre, 9 m. S. of Aix-la-Chapelle by rail. Pop. (1905) 14,207.

It is a flourishing commercial place, and besides cloth and buckskin mills it has net and glove manufactories, soapworks, dyeworks, tanneries and breweries, and also carries on a considerable trade in cattle and dairy produce. It has a Protestant and four Roman Catholic churches, a Franciscan monastery, a progymsiam, an orphanage, a hospital, and a chamber of commerce. As part of the duchy of Limburg, Eupen was under the government of Austria until the peace of Lunéville in 1801, when it passed to France. In 1814 it came into the possession of Prussia.

EUPHEMISM (from Gr. ἐφθέγμος, having a sound of good omen; ἐφ, well, and φθέγμος, sound or voice), a figure of speech in which an unpleasant or coarse phrase is replaced by a softer or less offensive expression. A euphemism has sometimes a metaphorical sense, as in the substitution of the word "sleep" for "death." EUPHONIUM (Fr. baryton; Ger. Tenor Tube), a modern brass wind instrument, known in military bands as euphonium and in the orchestra as tuba. The euphonium consists of a brass tube with a conical bore of wide calibre ending in a wide-mouthed bell; it is played by means of a cup-shaped mouthpiece. The sound is produced as in the bombard, which is the bass of the euphonium, by the varied tension of the lips across the mouth.

For a discussion of this see ARCHON.

The intervening notes of the chromatic scale are obtained by means of valves or pistons usually four in number, which by opening a passage into additional lengths of tubing lower the pitch of each one, half, one-and-one-half, and two-and-a-half tones (see BOMBARDON; TUBA; VALVES). The euphonium gives out the fundamental, or first note of the harmonic series, readily, but no harmonic above the eighth. Euphoniums are made in C and in B, the latter being more generally used. By means of all the valves used at once, the B, an octave below the fundamental, can be reached, giving a compass of four octaves, with chromatic intervals. The bass clef is used in notation. The euphonium is treated by French and German composers as a transposing instrument; in England the real notes are usually written, except when the treble clef is used. The quality of tone is rich and full, harmonizing well with that of the trombone. The euphonium speaks readily in the lower register, but slowly, for the long notes. Mesers Rudall Carte have removed this difficulty by their patent short action pistons, which have but half the dip of the old pistons. On these instruments it is easy to execute rapid passages.

The euphonium is frequently said to be a saxhorn, corresponding to the baryton member of that family, but the statement is misleading. The bombardon and euphonium, like the saxhorns, are the outcome of the application of valves to the bugle family, but there is a radical difference in construction; the tubas (bombardon and euphonium) have a conical bore of sufficiently wide calibre to allow of the production of the fundamental harmonic, which is absent in the saxhorns. The Germans classify brass wind instruments as whole and half according to whether, having the wide bore of the bugle, the whole length of the tube is available and gives the fundamental proper to an organ pipe of the same length or whether by reason of the narrow bore in proportion to the length, only half the length of the instrument is of practical utility, the harmonic series beginning with the second harmonic. (See BOMBARDON.)

(E. M. CL.)

EUPHORIA, in botany, a large genus of plants from which the order Euphorbiaceae takes its name. It includes more than 600 species and is of almost world-wide distribution. It is represented in Britain by the spurge—small, generally smooth, herbaceous plants with simple leaves and inconspicuous flowers arranged in small cup-like heads (cyathia). The cyathium is a characteristic feature of the genus, and consists of a number of male flowers, each reduced to a single stamen, surrounding a central female flower which consists only of a stalked pistil; the group of flowers is enveloped in a cup formed by the union of four or five bracts, the upper part of which bears thick, conspicuous, gland-like structures, which in exotic species are often brilliantly coloured, giving the cyathium the appearance of a single flower. Another characteristic is the presence of a milky juice, or latex, in the tissues of the plant. In one section of the genus the plants resemble cacti, having a thick succulent stem and branches with the leaves either very small or completely reduced to a small wart-like excrescence, with which is generally associated a tuft of spines (a reduced shoot). These occur in the warmer parts of the world as a type of dry country or desert vegetation. The only species of note are E. fulgens and E. miqueticifera, for the warm greenhouse; E. Cyparissias (the Cypress spurge), E. Wolensis, E. Lathyria and E. Myrsinaceae, for the open air.

EUPHORBIACEAE, in botany, a large natural order of flowering plants, containing more than 220 genera with about 1

1 See Dr Schaafhaut's article on "Musical Instruments" in sect. iv. of "Bericht der Beurtheitungs-Commission bei der Allgem. deutschen Industrieausstellung" (Munich, 1854), pp. 169-170; and Fried. Zimmer, Die Musik und die Musikinstrumente in ihrer Beschaffenheit zu dem Gegenstand der Musikwissenschaften (Gießen, 1855).
4000 species, chiefly tropical, but spreading over the whole earth with the exception of the arctic and cold alpine zones. They are represented in Britain by the spurge (Euphorbia, q.v.) (fig. 1) and dog’s mercury (Mercurialis) (fig. 2), which are herbaceous plants, but the greater number are woody plants and often trees. The large genus Euphorbia shows great variety in habit; many species, like the English spurge, are annual herbs, others form bushes, while in the desert regions of tropical Africa and the Canary Islands species occur resembling cacti, having thick fleshy stems and leaves reduced to spines. Another large genus, Phyllanthus, contains small annual herbs as well as trees, while in some species the leaves are reduced to scales, and the branches are flattened, forming phylloclades. The leaves also show great variety in form and arrangement, being simple and entire as in the English spurge, or deeply cut as in Ricinus (castor-oil) (fig. 3), and Manihot or sometimes palmately compound (Hevea). The majority contain a milky juice or latex in their tissues which exudes on cutting or bruising. In Hevea, Manihot and others the latex yields caoutchouc. The flowers are unisexual; male and female flowers are borne on the same, as in the spurge (fig. 1), or on different plants, as in dog’s mercury (fig. 2). Their arrangement shows considerable variation, but the flowers are generally grouped in crowded definite partial inflorescences, which are themselves arranged in spikes or stand in the axils of the upper leaves. These partial inflorescences are generally unisexual, the male often containing numerous flowers while the female flowers are solitary. The partial inflorescence (cyathium) of Euphorbia (fig. 1) resembles superficially a hermaphrodite flower. It contains a central terminal flower, consisting of a naked pistil; below this are borne four or five bracts which unite to form a cup-shaped involucre resembling a calyx; each of these bracts subtends a small cyme of male flowers each consisting only of one stamen. Between the segments of the cup are large oval or crescent-shaped glands which are often brightly coloured, forming petal-like structures.

The form of the flower shows great variety. The most complete type occurs in Wielandia, a shrub from the Seychelles Islands, in which the flowers have their parts in fives, a calyx and corolla being succeeded in the male flower by 5 stamens, in the female by 5 carpels. Generally, however, only 3 carpels are present, as in Euphorbia; Mercurialis (fig. 2) has minute apetalous flowers with 3 sepals, followed in the male by 8 to 20 stamens, in the female by a bicarpellary pistil. In the large tropical genus Croton a pentamersous calyx and corolla are generally present, the stamens are often very numerous, and the female flower has three carpels. In Manihot, a large tropical American genus to which belongs the manioc or cassava (M. utilissima), the calyx is often large and petaloid. In a great many genera the corolla is absent. The most reduced type of flower is that described in Euphorbia, where the male consists of one stamen separated from its pedicle by a joint, and the female of a naked tricarpellary pistil. The stamens are sometimes more or less united (monadelphous), and in castor-oil (Ricinus) (fig. 3) are much branched. The ovary generally contains three chambers, and bears three simple or more often bipartite styles; each chamber contains one or two pendulous ovules, which generally
behave a cap-like outgrowth or caruncle, which persists in the seed (well shown in castor oil, fig. 3).

As the stamens and pistil are borne by different flowers, cross-fertilization is necessary. In Mercurialis and others with inconspicuous flowers pollination is effected by the wind, but in many cases insects are attracted to the flower by the highly-coloured bracts, as in many Euphorbias and Dipsacum, or by the coloured calyx as in Manihot; the presence of honey is also frequently an attraction, as in the honey-glands on the bracts of the cyathium of Euphorbia. The fruit is generally a capsule which splits into three divisions (cocos), separating from the central column, and splitting lengthwise into two valves. In the macciniol (Hippomane macciniol) of Central America the fruit is a drupe like a plum, and in some genera berries occur. In the sandbox tree (Hura crepitans) of tropical America the ovary consists of numerous carpels, and forms when mature a capsule which splits with great violence and a loud report into a number of woody cocos. The seeds contain abundant endosperm and a large straight or bent embryo.

Several members of the order are of economic importance.

euphorbione, C₄H₅O or C₆H₉O. Pliny states that the name of the drug was given to it in honour of Euphorbus, the physician of Juba II., king of Mauretania. In former times euphorbione was valued in medicine for its drastic, purgative and emetic properties.

Euphorbus, son of Panthois, one of the bravest of the Trojan heroes, slain by Menelaus (IIiad, xvii. 1-60). Pythagoras, in support of his doctrine of the transmigration of souls, declared that he had once been this Euphorbus, whose shield, hung up in the temple of Argos by Menelaus, he claimed as his own (Horace, Odes, i. 28. 11; Diog. Laërt. viii. 1).

Euphorion, Greek poet and grammarian, born at Chalcis in Euboea about 275 B.C. He spent much of his life in Athens, where he amassed great wealth. About 221 he was invited by Antiochus the Great to the court of Syria. He assisted in the formation of the royal library at Antioch, of which he held the post of librarian till his death. He wrote mythological epics, amatory elegies, epigrams and a satirical poem (Aepi, "curses") after the manner of the Ibis of Callimachus. Prose works on antiquities and history are also attributed to him. Like Lyco phon, he was fond of using archaic and obsolete expressions, and the erudite character of his allusions rendered his language very obscure. His elegies were highly esteemed by the Romans; they were imitated or translated by Cornelius Gallus and also by the emperor Tibertus.

Fragments in Meineke, "De Euphorionis Chalcidensis vita et scriptis," in his Analecta Alexandrina (1843); for a recently discovered fragment of about 30 lines see Berliner Klassikertexte, v. 1 (1907).

Euphranor, of Corinth (middle of the 4th century B.C.), the only Greek artist who excelled both as a sculptor and as a painter. In Pliny we have lists of his works; among the paintings, a cavalry battle, a Theseus, and the feigned madness of Odysseus; among the statues, Paris, Leto with her children Apollo and Artemis, Philip and Alexander in chariots. Unfortunately we are unable among existing statues to identify any which are copies from works of Euphranor (but see a series of attributions by Six in Jahrbuch, 1909, 7 foll.). He appears to have resembled his contemporary Lysippus, notably in the attention he paid to symmetry, in his preference for bodily forms lighter than those usual in earlier art, and in his love of heroic subjects. He wrote a treatise on proportions.

Euphrates (Babylon. Parudut, Heb. Perath, Arab. Frat or Furdi, Old Pers. Ufrata, Gr. Εὐφράτης), the largest river of western Asia. It may be divided into three divisions, upper, lower and middle, each of which is distinguished by special physical features, and has played a conspicuous part in the world's history, retaining to the present day monumental evidence of the races who have lived its banks.

Upper Division.—The upper Euphrates consists of two arms, which, rising on the Armenian plateau, and flowing west in long shallow valleys parallel to Mount Taurus, eventually unite and force their way southward through that range to the level of Mesopotamia. The northern or western and shorter arm, called by the Turks Kara Su, "black water," or Frat Su (Armenian, Ekhrut or Tekhru; Arab. Nahar el-Furat or Frat), well known to the ancients as the Euphrates, from its being the boundary of the Roman empire, is regarded also by Orientals as a main stream. It rises in the Dumlu Dağh, N.N.W. of Erzerum, in a large circular pool (altitude, 8625 ft.), which is venerated by Armenians and Moslems, and flows south-east to the plain of Erzerum (5750 ft.). Thence it continues through a narrow valley W.S.W. to Erzirag (3000 ft.), receiving on its way the Ovajik Su (right), the Tuzla Su (left), and the Merjan and Chanduklu (right). Below Erzirag the Frat flows south-west through a rocky gorge to Kemakh (Komach; Armenian, Gomakh), where it is crossed by a bridge and receives the Kumur Su (right). At Avshin it enters a cañon, with walls over 1000 ft. high, which extends to the bridge at Pingen, and lower down it is joined from the west by the Chalta Irmak (Lykeus; Arab. LhHyu), on which stands Dvirik (Tephrkhe). Then, entering a deep gorge with lofty rock walls and magnificent scenery, it runs...
south-east to its junction with the Murad Su. The Frät, separated by the easy pass of Deve-boyun from the valley of the Araxes (Aras), marks the natural line of communication between northern Persia and the West—a route followed by the nomad Turks, Mongols and Tatars on their way to the rich lands of Asia Minor. The Frät is joined here by the river of the country of Ararat. The Erzincan is navigable, down stream, for rafts. The southern or eastern and longer arm, called by the Turks Murad Su (Armenian Aradou, Arab. Nahar Arasou), rises south-west of Diadin, in the northern flank of the Ala Dagh (11,500 ft.), and flows west to the Alashgerd plain. Here it is joined by the Sharian Su from the west, and the two valleys form a great trough through which the caravan road from Erzerum to Persia runs. The united stream breaks through the mountains to the south, and, receiving on its way the Patnitou Su (left) and the Khina Su (right), flows south-west, west and south, through the rich plain of Bulanik to the plain of Mäsh. Here it is joined by the Kara Su (Teleboas), which, rising near Lake Van, runs past Mäsh and waters the plain. The river now runs W.S.W. through a deep rocky gorge, in which it receives the Gunig Su (right), to Palu (where there are cuneiform inscriptions), and continues through more open country to the junction with the Frät. 50 m. E.N.E. of Kout 40 m. the Murad is joined by its principal tributary, the Peri Su, which drains the wild mountain district, Dersäm, that lies in the loop between the two arms. The Murad Su is of greater volume than the Frät, but its valley below Mäsh is contracted and followed by no great road. Below the junction of the two arms the Euphrates flows south-west past the lead mines of Keban Maden, where it is 120 yds. wide, and is crossed by a ferry (altitude, 2425 ft.), on the Sivas-Kharput road. It then runs west, south and east round the rock-mass of Musher Dagh, and receives (right) the Kuru Chai, down which the Sivas-Malatia road runs, and the Tkohma Su, from Gorun (Gaurainia) and Darenre. At the ferry on the Malatia-Kharput road (cuneiform inscription) it flows eastwards in a valley about a quarter of a mile wide, but soon afterwards enters a remarkable gorge, and forces its way through Mount Taurus in a succession of rapids and cataracts. After running south-east through the grandest scenery, and closely approaching the source of the western Tigris, it turns south-west and leaves the mountains a few miles above Samsät (Samosota; altitude, 1500 ft.). The general direction of the great gorges of the Euphrates, Pyramus (Jihan) and Sarus (Sihun) seems to indicate that their formation was primarily due to the same terrestrial movements that produced the Jordan-Arabian depression to the south. The length of the Frät is about 275 m.; of the Murad, 471 m.; and of the Euphrates from the junction to Samsät, 115 m.

Middle Division.—The middle division, which extends from Samsät to Hit, is about 720 m. long. In this part of its course the Euphrates runs through an open, treeless and sparsely peopled country, in a valley a few miles wide, which it has eroded in the rocky surface. The valley bed is more or less covered with alluvial soil, and cultivated in places by artificial irrigation. The method of this irrigation is peculiar. Three or four piers, sometimes bridges of masonry are run out into the bed of the river, frequently from both sides at once, raising the level of the stream and thus giving a water power sufficient to turn the gigantic wheel or wheels, sometimes almost 40 ft. in diameter, which lift the water to a trough at the top of the dam, whence it is distributed among the gardens and melon patches, rice, cotton, tobacco, liquorice and durra fields, between the immediate bed of the river and the rocky banks which shut it out from the desert. The wheels, called naqars, are of the most primitive construction, made of rough branches of trees, with palm leaf paddles, rude clay vessels being slung on the outer edge to catch the water, of which they raise a prodigious amount, only a comparatively small part of which, however, is poured into the aqueducts on top of the dams. These latter are exceedingly picturesque, often consisting of a series of well-built Gothic arches, and give a peculiar character to the scenery; but they are also great impediments to navigation. In some parts of the river, too naqars have been counted within a space of 130 m., but of late years many have fallen into decay. By far the larger part of the valley is quite uncultivated, and much of it is occupied by tamarisk jungles, the home of countless wild pigs. Where the valley is still cultivated, the jerd, a skin raised by oxen, is gradually being replaced by the tamarisk village. This is not, however, being constructed to take the place of those which fall into decay.

In this part of its course the rocky sides of the valley, which sometimes closely approach the river, are composed of marls and gypsum, with occasional selenite, overlaid with sandstone, with a topping of breccia or conglomerate, and rise at places to a height of 200 ft. or more. At one point, however, 20 m. above Deir, where lie the ruins of Halebiya, the river breaks through a great natural dam of some 300 ft. high. On either side of the river valley a steppe-like desert is covered in the spring with verdure, the rest of the year barren and brown, stretches away as far as the eye can see. Anciently the country on both sides of the Euphrates was habitable as far as the river Khabur; at the present time it is all desert from Birejik downward, the camping ground of Bedouin Arabs, the great tribe of Anazeh occupying esh Shám, the right bank, and the Shammar the left bank, Mesopotamia of the Romans, now called Ježirëh or the island. To these the semi-sedentary Arabs who sparsely cultivate the river valley, dwelling sometimes in huts, sometimes in caves, pay a tribute, called kubbe, or brotherhood, as do also the riverain towns and villages, except perhaps the very largest. The Turkish government also levies taxes on the inhabitants of the river valley, and for this purpose, and to maintain a caravan route from the Mediterranean coast to Bagdad, maintains stations of a few sipkis or gen de armes, round Jezeirëh or the island.

In early times the Euphrates was important as a boundary. It was the theoretical eastern limit of the Jewish kingdom; for a long time it separated Assyria from the Khita or Hittites; it divided the eastern from the western satrapies of Persia (Ezra iv. 17; Neh. iv. 7); and it was at several periods the boundary of the Roman empire. Until the advent of the nomads from central Asia, and the devastation of Mesopotamia and the opposite Syrian shore of the river, there were many flourishing cities along its course, the ruins of which, representing all periods, still dot its banks. Samsät itself represents the ancient Samosata, the capital of the Seleucid kings of Commagene (Kumukh of the Assyrian inscriptions), and here the Persian Royal Road along which the mail to Susa is supposed to have crossed. The river Samsät the river runs S.W. to Rum-Kaleh, or “castle of the Romans” (Armenian, Hrhomglo). At this point was another passage of the river, defended by the castle which gives its name to the spot, and which stands on a high hill overlooking the right bank; its base washed by an abundant stream, the Sanjeh (G. Żawja), which enters the Euphrates on the west. From this point the river runs rather east of south for about 25 m. past Kallat (ferry) to Birejik or Bir, the ancient Bithra, where it is only 110 m. from the Mediterranean, the bed of the river being 628 ft. above that sea. This was the Apamea-Zeugma, where the high road from east to west crossed the river, and it is still one of the most frequented of all the passages into Mesopotamia, being the regular caravan route from Iskanderun and Aleppo to Urfa, Diarbekr and Mosul. From Birejik the river runs sluggishly, firstly a little to the east, then a little to the west of south, over a sandy or pebbly bed, past Jeralbus (? Eureus, Carcemisch, the ancient Hittite capital), near which the Sajur (Sagera; Sangar of the Assyrian inscriptions) enters from the west, to Meskene, 2 m. southward of which are the ruins of Barbalissus (Arab. Balis), the former port of Aleppo, now, owing to changes in the bed, some distance from the water. Six miles below this the ruins of Kal'at Dibse mark the site of the ancient Thatspucus (Thaspus of 1 Kings iv. 24), the most important passage of the middle Euphrates, where both Cyrus and Darius led their expeditions against his brother, and Alexander the Great crossed
that river, and the ancient port of Syria. Here the river turns quite sharply eastward. A day's journey beyond Meskeene are the remains of Sifin (Roman Sephe), where Moawiyah defeated the caliph Ali in 657 (see CAPPADOCIA), and opposite this, on the west bank, a picturesque ruin called Kal'at Ja'ber (Dawasara). A day's journey beyond this, on the Syrian side, stand the remains of ancient Sura, a frontier fortress of the Romans against the Parthians; 20 m. S. of which, inland, lie the well-preserved ruins of Reseph (Assyrian, Resafa or Rasafa). Half a day's journey beyond Sura, on the Mesopotamian side of the river, are the extensive ruins of Haragia (Heraclea) and Rakka, once the capital of Harun al-Rashid (Nicephorion of Alexander; Calthinus of the Seleucids and Romans). Here the Belikh (Bilekhas) joins the Euphrates, flowing southward through the biblical Aram Naharin from Urfa (Edessa) and Harran (Carrhae); and from this point to el-Kaim four days' below Deir, the course of the river is south-easterly. Two days' journey beyond Rakka, where the Euphrates breaks through the basalt dike of el-Hamme, are two admirably preserved ruins, built of gypsum and basalt, that on the Mesopotamian side called Zelebiya (Chanagua), and that on the Syrian, much the finer of the two, Halebiya or Zenobliya, the ancient Zenobia. Twenty-six miles farther down lies the town of Deir (q.v.), where the river divides into two channels and the river valley opens out into quite extensive plains. Here the roads from Damascas, by way of Palmyra, and from Mosul, by way of the Khabur, reach the Euphrates, and here there must always have been a town of considerable commercial and strategic importance. The region is to-day covered with ruins and ruin mounds. A little below Deir the river is joined by the Khabur (Khaboras, Biblical Khaber), the frontier of the Roman empire from Diocletian's time, which rises in the Karaja Dagh, and, with its tributary, the Jaghijag (Mygodonius; Arab. Hirmas) flows south through the land of Gozan in which Sargon settled the deported Israelites in 721 B.C. At the mouth of the Khabur stood the Roman frontier fortress of Circesium (Assyrian, Sirki; Arab. Kirsishe) now el-Buseira. The corresponding border town on the Syrian side is represented by the picturesque and finely preserved ruins called Salahiya, the Ad-dalie or Dalle (Adadia) of Arabic times, two days below Deir, whose more ancient name is as yet unknown. Between Salahiya and Deir, on an old canal, known in Arabic times as Said, leaving the Euphrates a little below Deir and rejoining it above Salahiya, stand the almost most picturesque ruins of the once important Arabic fortress of Raqba.

As far as the Khabur Mesopotamia seems to have been a well-inhabited country from at least the 15th century B.C., when it constituted the Hittite kingdom of Mitanni, down to about the 17th century a.d., and the same is true of the country on the Syrian side of the Euphrates as far back as Palmyrene. Below this point the back country on the Syrian side has always been a complete desert. On the Mesopotamian side there would seem, from the accounts of Xenophon and Ptolemy, to have been an affluent which joined the Euphrates between Deir and 'Ana, called Araxes by the former, Sacochara by the latter; but no trace of such a stream has been found by modern explorers and the country in general has always been unhabituated. Below Salahiya the river-bed narrows and becomes more rocky. A day's journey beyond Salahiya, on a bluff on the Mesopotamian side of the river, are the conspicuous ruins of el-Irsi (Cortus?). Half a day's journey beyond, at a point where two great wadis enter the Euphrates, on the Syrian side, stands Jabriya, an unidentified ruined town of Babylonian type, with walls of unbaked brick, instead of the stone heretofore encountered. At this point the river turns sharply a little north of east, continuing on that course somewhat onward becomes 'Ana, where it bends again to the south-east. Just above 'Ana are rapids, and from this point to Hitt the river is full of islands, while the bed is for the most part narrow, leaving little cultivable land between it and the bluffs. 'Ana itself, a very ancient town, of Babylonian origin, once sacred probably to the goddess of the same name, lay originally on several islands in the stream, where ruins, principally of the Arabic and late Persian period, are visible. Here palm trees, which had begun to appear singly at Deir, grow in large groves, the olive disappears entirely, and we have definitely passed over from the Syrian to the Babylonian flora and climate. Between 'Ana and Hit there were anciently at least four island cities or fortresses, and at the present time three such towns, insignificant relics of former greatness, Haditha, Artila (Ar'Uza) and Jibja still occupy the old sites. Of these Alus is evidently the ancient Auzara or Uzamasopolis, the city of the old Arabian goddess 'Uzza; Haditha, an important town under the Abbasids, was earlier known as Baia Malcha; while Jibja has not been identified. The fourth city, Thilutha or Olabus, once occupied the present deserted island of Telbeis, half a day's journey below 'Ana. About half-way between 'Ana and Hit, in the neighbourhood of Haditha, the river has a breadth of 300 yds., with a depth of 18 ft., and a flood speed of 4 knots. At this point we begin to encounter sulphur springs and bitter streams redolent with bitumen, a formation which reaches its climax at Hit (q.v.), where a small stream (the "river of Abava") of Ezra viii. 21) enters the Euphrates from the Syrian side, on which, about 8 m. from its mouth, stands the small town of Kubeitha.

The middle Euphrates, from Samas to Hit, is to-day an avenue of ruins, of which only the more conspicuous or important have been indicated here. It was from a remote period, antedating certainly 3000 B.C., the highway of empire and of commerce between east and west, more specifically between Babylonia or Irak and Syria, and numerous empires, peoples and civilizations have left their records on its shores. Its time of greatest prosperity and importance was the period of the Abbasid caliphate, and Arabic geographers as late as a.d. 1200 mention an astonishingly large number of important cities situated on its shores or islands. The Mongol invasion, in the latter part of that century, wrought their ruin, however, and from that time to the present there has been a steady decline in the commercial importance of the Euphrates route, and consequently also of the towns along its course, until at the present time it is only an avenue of ruins.

Lower Division.—Hit stands almost at the head of the alluvial deposit, about 350 m. from the Persian Gulf, separated from it by a couple of small spurs of the Syrian plateau, and may be said to mark the beginning of the lower Euphrates. Thence the river flows S.E. and S.S.E. to its junction with the Tigris below Korna, through an unbroken plain, with no natural hills, except a few sand (or sandstone?) hills in the neighbourhood of Warka, and no trace of rock, except at el-Haswa, above Hillah. At Hit the river is from 30 to 35 ft. in depth, with a breadth of 250 yds., and a current of 4 m. an hour, but from this point it diminishes in volume, receiving no new affluents but dissipating itself in many lagoons and inlets, especially to the east. At Hit the Euphrates and Tigris closely approach each other, and then, widening out, enclose the plain of Babylonia (Arab. Sawadd). Through this part of its course the current of the river, except where restricted by floating bridges—at Felujah, Musaafa, Hillah, Diwanieh and Samawa—does not normally exceed a mile an hour, and both on the main stream and on its canals the jerd or ox-bucket takes the place of the naasor or water-wheel for purposes of irrigation.

In early times irrigating canals distributed the waters over the plain, and made it one of the richest countries of the East, so that historians report three crops of wheat to have been raised in Babylonia annually. As main arteries for this circulation of water through its system great canals, constituting in reality so many branches of the river, connected all parts of Babylonia, and formed a natural means both of defence and also of transport from one part of the country to another. The first of these canals, taken off on the right bank of the river a little below Hit, followed the extreme skirt of the alluvium the whole way to the Persian Gulf near Basra, and thus formed an outer barrier, strengthened at intervals with watch-towers and fortified posts, to protect the cultivated land of the Sawadd against the incursions of the desert Arabs. This gigantic work, the line of which may still be traced throughout its course, was formerly
called the "Khandak Sabur" or "Sapor's trench," being ascribed to the Sassanian king, Shapur I. Dholalta, but is now known as the Cherra-Saadeh, and is in the popular tradition said to have been excavated by a man from Basra at the behest of a woman of Hit who wished to make her daughter a princess. How or when such a work was begun is not clear, but it would appear to have been at least largely reconstructed in the time of the great Nebuchadrezzar. The next important canal, the Dujayl (Doyalj), left the Euphrates on the left, about a league above Ramadiya (Ar-Rabb), and flowed into the Tigris between Ubbara and Bagdad. The 'Isla, which is largely identical with the modern Sakhliwia, left the Euphrates a little below Anbar (Parsakbura) and joined the Tigris at Bagdad. This current still carried water and was navigable by steamers until about 1875. Sarsar, the modern Abu-Churayb, leaves the Euphrates three leagues lower down and enters the Tigris between Bagdad and Ctesiphon. The Naher Malik or royal river, modern Radwaniya, leaves the Euphrates five leagues below this and joins the Tigris three leagues below Ctesiphon; while the Kutha, modern Habil-Ibrahim, leaving the Euphrates three leagues below the Malik joins the Tigris ten leagues below Ctesiphon. In the time of the Arabs these were the chief canals, and the cuts from the main channels of the Naher 'Isla, Naher Sarsar, Naher Malik (or Naher Malcha), and Naher Kutha, reticulating the entire country between the rivers, converted it into a continuous and luxuriant garden.

Just below Mussaib there has been for all ages a great bifurcation of the river. The right arm was the original bed, and the left arm, on which Babylon was built, the artificial deviation, as is clear from the cuneiform inscriptions. In the time of Alexander the nomenclature was reversed, the right arm being known as Pallacopas. Under the Arabs the old designation again prevailed and the Euphrates is always described by the Arabian geographers as the river which flows direct to Kufa, while the present stream, passing along the ruins of Babylon to Hillah and Diwaniheh, has been universally known as the Naher Sura. Occidental geographers, however, have followed the Greek use, and so to-day we call the river of Babylon or Naher Sura the Euphrates and the older westerly channel the Hindieh canal.

At the present time the preservation of the embankments about the point of bifurcation demands the constant care of the Bagdad government. The object is to allow sufficient water to drain off to the westward for the due irrigation of the land, while the Hillah bed still retains the main volume of the stream, and is navigable to the sea. But it frequently happens that the dam at the head of the Hindieh is carried away, and, a free channel being thus opened for the waters of the river to the westward, the Hillah bed shoals to 2 or 3 ft., or even dries up altogether, while the country to the west of the river is turned into lakes and swamps. Below the bifurcation the river of Babylon was again divided into several streams, and indeed the most famous of all the ancient canals was the Arakat (Archaeus of the Greeks and Serrat and Nil of the Arabs), which left that river just above Babylon and ran due east to the Tigris, irrigating all the central part of the Jezireh, and sending down a branch through Nippur and Ereh to rejoin the Euphrates a little above the modern Nasratch. The Naras, also, the modern Daghbara, which is still navigable to Nippur and beyond, left the Sura a little below Hillah; and at the present day another large canal, the Kehr, branches off near Diwaniheh. It is easy to distinguish the great primitive watercourses from the lateral ducts which they fed, the latter being almost without banks and merely traceable by the winding curves of the layers of alluvium in the bed, while the former are hedged in by high banks of mud, heaped up during centuries of dredging.

Not a hundredth part of the old irrigation system is now in working order. A few of the mouths of the smaller canals are kept open so as to receive a limited supply of water at the rise of the river in May, which then distributes itself over the lower lying lands in the interior, almost without labour on the part of the cultivators, giving birth in such localities to the most abundant crops, but by far the larger portion of the region between the rivers is at present an arid howling wilderness dotted with tels or ruin-heaps, streaked in the most part with broken pottery, the evidence of former habitation, and bearing nothing but the camel-thorn, the wild caper, the colocynth-apple, wormwood and other weeds of the desert. The swamps are full of little cranes, and the jungles of the Tigris and Euphrates reach, where the water stretches out into great marshes, the river is clogged with a growth of aquatica. To obtain a correct idea of this region it must be borne in mind also that the course of the river and the features of the country on both banks are subject to constant fluctuation. The Hindieh canal and the main stream, the ancient Sura, rejoin one another at Samawa. Down to this point, the bed of the Euphrates is higher than that of the Tigris, but below this the situation is reversed. At Nasratch the Shatt-el-Hai, at one time the bed of the Tigris, and still navigable during the greater part of the year, joins the Euphrates. From this point downward, and to some extent above this as far as Samawa, the river forms a succession of reedy lagoons of the most hopeless character, the Paludes Chaldaii of antiquity, el Batihf of the Arabs. Along this part of its course the river is apt to be choked with reeds and, except where bordered by lines of strong dikes, the channel loses itself in lakes and swamps.

The inhabitants of this region are wild and inhospitable and utterly beyond the control of the Turkish authorities, and navigation of the river between Korna and Suk-esh-Sheiksh is unsafe owing to the attacks of armed pirates. From Garmat Ali, where the Tigris and Euphrates at present unite,1 under the title of Shatt-el-Arab, the river sweeps on to Basra, 1,000 yds. in width, and from 3 to 5 fathoms deep, navigable for steamers of good size. From Korna, the Parthian city of Spasini-Charax, which was succeeded by Bahman Ardshir (Bamishir) under the Sassanians, and by Moharzi under the Arabs. The left bank of the river from this point belongs to Persia. It consists of an island named Abbadan, about 45 m. long, formed by alluvial deposits during the last fifteen centuries. (For the character of this alluvium and its rate of deposit see IRAK.)

Even more than the upper and middle Euphrates the lower Euphrates, from Hit downstream, abounds in ruins of ancient towns and cities, from the earliest prehistoric period onward to the close of the Caliphate (see IRAK). The fact also that many of the most ancient of these ruins, like Ur, Lagash (Sirpurla), Larsa, Ereh, Nippur, Sippara and Babylon, were situated on the banks of the great canals would indicate that the control of the waters of the rivers by a system of canalization and irrigation was one of the first achievements of civilization. This ancient system of canalization was inherited from the Persians (who, in turn, inherited it from their predecessors), by the Arabs, who long maintained it in working order, and the astonishing fertility and consequent prosperity of the country watered by the Euphrates, its tributaries and its canals, is noticed by all ancient writers. The land itself, an alluvial deposit, is very fruitful. Wheat and the date palm seem to have been indigenous, and the latter is still one of the chief products of the country, but in later years rice has taken the place of wheat as the staff of life. The decline of the country dates from the appearance of Turkish nomads in the 11th century; its ruin was completed by the Shammar Arabs in the 17th century; but, if the ancient system of irrigation were restored, sufficient grain could be grown to alter the conditions of the wheat supply of the world. At the present time, instead of the innumerable

1. The confluence for about 500 years was at Korna, over 30 m. higher up. Sir W. Wilcock discovered (1909) that from Suk-esh-Sheiksh the Euphrates had formed a new channel through the marshes. (See Eng. Journal, Jan. 1910.)
EUPHRONIUS—EUPHUISM

cities of former days, there is a succession of small towns along the course of the river—Ramadiya, Faluja, Mussabah, Hillab, Diwaniyah, Samawa, el-Khudr (an ancient daphne or sacred grove, 33° 11' 58" N., 76° 6' 0" E., the only one anywhere which preserves to this day its ancient charter of the inviolability of all life within its precincts), Nasrieh and Suk-es-Sheikh—by means of which the Turkish government controls the river and levies tax on a small part of the adjacent territory. All such settlements the river is lined with gardens and plantations of palms. The greater part of the region, however, even along the river shores, is inhabited only by roaming Bedouin or half-savage Ma'dan Arabs (see Israk).

Navigation.—The length of the Euphrates from its source at Diadin to the sea is about 1500 m., and its fall during the last 1200 m. about 10 ins. per mile. The river begins to rise in the end of March and attains its greatest height between the 21st and the 28th of May. It is lowest in November, and rocks, shallows, and the remains of old dams then render it almost un navigable. In antiquity, however, it was evidently in use for the transportation of merchandise and even of armies. Boats built in Syrian ports were placed on the Euphrates by Sennacherib and Alexander, and Herodotus states (i. 185) that in his day the river was a frequented route followed by merchants on their way from the Mediterranean to Babylon. As the most direct line of transit between the Mediterranean and the Persian Gulf, offering an alternative means of communication with India, not greatly inferior to the Egyptian route, the Euphrates route early attracted the attention of the British government. During the Napoleonic wars, indeed, and up to the time when the introduction of steam navigation rendered the Red Sea accessible at all seasons of the year, the political correspondence of the home and Indian governments usually passed by the Euphrates route. Various plans were suggested for the development of this route as a means of goods as well as postal conveyance, and in 1835 Colonel F. R. Chesney was sent out at the head of an expedition with instructions to transport two steamers from the Mediterranean to the Euphrates, and, after putting them together at Birejik, to attempt the descent of the river to the sea. One of these steamers was lost in a squall during the passage down the river near el-Irsi, but the other performed the voyage in safety and thus demonstrated the practicability of the downward navigation. Following on this first experiment, the East India Company, in 1841, proposed to maintain a permanent flotilla on the Tigris and Euphrates, and set two vessels, the "Nitrocis" and the "Nimrod," under the command of Captain Campbell of the Indian navy, to attempt the ascent of the latter river. The experiment was so far successful that, with incredible difficulty, the two vessels did actually reach Meskene, but the result of the expedition was to show that practically the river could not be navigated by a high-speed steamer, and the means were adopted of reducing the rapids and falls during the low season, caused mainly by the artificial obstructions of the irrigating dams, being insurmountable by ordinary steam power, and the aid of hundreds of hands being thus required to drag the vessels up the stream at those points by main force. Under Midhat Pasha, governor-general of Bagdad from 1866 to 1871, an attempt was made by the Turkish authorities to establish regular steam navigation on the Euphrates. Many of the dams caused many of the stream to be destroyed and for some years occasional steamers were run between Meskene and Hillah in flood time, from April to August. But with the transfer of Midhat this feeble attempt at navigation was abandoned. At the present time the river is navigated by sailing craft of some size from Hit downward. Above that point there is no navigation except by the native rafts (kelde), which descend the river and are broken up on arrival at their point of destination. There is, however, the travel of this sort on the Euphrates in comparison with the amount on the Tigris.

When it became evident that, under present conditions at least, the navigation of the middle Euphrates was impracticable, attention was turned, owing to the peculiarly advantageous geographical position of its valley, to schemes for connecting the Mediterranean and Persian Gulf by railway as an alternative means of communication with India, and various surveys were made for this purpose and various routes laid out. All these schemes, however, fell through either on the financial question, or on the unwillingness of the Turkish government to sanction any line not connected directly with Constantinople. With the acquisition of the Suez Canal, moreover, the value of this route from the British standpoint was so greatly diminished that the scheme, so far as England was concerned, was quite abandoned. (For further notice of the railway question see Bagdad.)

EUPHRONIUS, the most noted of the group of great vase-painters, who lived in Athens in the time of the Persian wars, and whose names are known to posterity (see G allocations and Araba).

There is a monograph by W. Klein dealing with the artist. As all the great paintings of Greece have disappeared, we are obliged to trust to the designs on vases for our knowledge of Greek drawing and composition. Euphronis is still and archaic in style, but his subjects are varied, his groupings original and striking, and his mastery of the line decided. In their way, the vases which he painted will hold their own in comparison with those of our own nation; for simplicity, truthfulness and charm they can scarcely be matched.

EUPHROSyne, the name of two Byzantine empresses.

1. Euphrosyne, a daughter of Constantine VI. Although she had taken a monastic vow she became the second wife of Michael II. (q.v.), a marriage which was practically forced upon her by Michael, who was anxious to strengthen his claims to the throne by an alliance with the last representative of the Isaurian dynasty, and secured the compliance of senate and patriarch with his desire. No issue was born of this union, and after the death of her husband and accession of her stepson Theophilus Euphrosyne again retired into a convent.

2. Euphrosyne, the wife of Alexius III. (q.v.). After securing the election of her husband to the throne by wholesale bribery she virtually took the government into her hands and restored the waning influence of the monarchy over the nobles. In spite of her talent for government she went far to hasten the empire's decay. By her unbridled generosity, the extravagance of her extravagance, she ruined the state. Her name was unpopular by her open profligacy, which went unpunished but for one short term of banishment. She followed her husband into exile in 1163 and died seven years later in Epirus.

EUPHUISM, the peculiar mode of speaking and writing brought into fashion in England towards the end of the reign of Elizabeth by the vogue of the fashionable romance of Euphuism, published in 1578 by John Lyly. As early as 1570 Ascham in his Scholemaecker had said of Euphuism (so called, he supposed, endued by nature, from the Gr. èp, φυς, well, growth) "is 't he that is apt by goodness of wit, and applicable by readiness of will, to learning, having all other qualities of the mind and parts of the body that must another day serve learning." Lyly adopted this word as the name of the hero of his romance, and it is with that he the vogue of Euphuism began. John Lyly, "always averse to the crabb'd studies of logic and philosophy, and his mind being naturally bent to the pleasant paths of poetry," devoted himself exclusively to the service of the ladies, a thing absolutely unprecedented in English literature. He addressed himself to "the gentlewomen of England," and he had the audacity, in that grave age, to say that he would rather see his books "lie shut in lady's casket than open in a scholar's study." In order to attain this object, he set himself to create a
superfine style in writing, and to illustrate this in his compositions. He undertook to produce a pleasurable literature for the boudoir and the bower. Lyly was twenty-six when he published in 1579 the first part of Euphues: the Anatomy of Wit; a second part, entitled Euphues and his England, appeared in 1580. His object was diametrically opposed to that of writers who had striven to instruct, reprove or edify their contemporaries. Lyly, assuming that women only will read his book, says:—"After dinner, you may overlook it to keep you from sleep, or if you be heavy to bring you asleep, for the work upon a full stomach is against physic, and therefore better were it to hold Euphues in your hands, though you let him fall when you be willing to wink, than to sew in a closet and prick your fingers when you begin to read."

For a comprehension of the nature of Euphues it is necessary to remember that the object of its invention was to attract and to disarm the ladies by means of an ingenious and playful style, of high artificiality, which should give them the idea that they were being entertained by an enthusiastic adorer, not instructed by a solemn pedagogue. For fifty years the romance of Euphues retained its astonishing popularity. As late as 1622 the publisher Edward Blount (1560?–1632), recalling the earliest enthusiasm of the public, wrote of John Lyly, "Oblivion shall not so trample on a son of the Muse, and such a son as they call their darling. Our nation is in her debt for a new English which he taught them. Euphues and his England began first that language. And we, our judges, were then his scholars, and that beauty in Court, which could not parley Euphues, was as little regarded, as she which, now there, speaks not French." Among those who applied themselves to this "new English," one of the most ardent was Queen Elizabeth herself, who has been styled by J. R. Green "the most affected and destatable of euphuists." At the height of the popularity of this strange dialect, it was said by William Webbe, in his Discourse of English Poety (1586), to consist in a combination of exact eloquence and grave composition of apt words and sentences, in fit phrases, in pithy sentences, in gallant tropes, in flowing speech," while a French poet of the same age calls Lyly a "raffineur" of the English speech; another panegyrist describes him as "alter Tullius," meaning that, in inventing Euphues, he had introduced into English the refinements of a Ciceroan style.

When we put aside these excessive compliments, and no less attacks from singular style suffered as soon as it began to go out of fashion, we are able to observe merits as well as faults in this very curious experiment. Euphues did not attempt to render the simplicity of nature. On the contrary, in order to secure refinement, it sought to be as affected, as artificial, as high-pitched as possible. Its most prominent feature was an incessant balancing of phrases in chains of antitheses, thus:—"Though the tears of the hart be salt, yet the tears of the boar be sweet, and though the tears of some women be counterfeit to deceive, yet the tears of many be current to try their love;" or this:—"Reject it not because it proceedeth from one which hath been lewd, no more than ye would neglect the gold because it lieth in the dirty earth, or the pure wine for that it cometh out of a homely presser, or the precious stone aetinis which is found in the filthy nests of the eagle, or the precious gem dracoulis, that is ever taken out of the poisoned dragon." This second excerpt, moreover, suggests another of the main characteristics of Euphues, the incessant use, for purposes of ornament, of similes taken from fabulous records of zoology, or relating to mythical birds, fishes or minerals. This was a feature of the "new English" which was excessively admired, and copied with a senseless extravagance. Instances of it are found on every page of Lyly's books, thus:—"Although the worm entereth almost into every wood, yet he eateth not the cedar-tree; though the stork cyprianus at every thunder-clap rolleth from hill to hill, yet the pure sleek stone mounteth at the noise; though the rust fret the hardest steel, yet doth it not eat into the emerald; though polypus change his hue, yet the salamander keepeth his colour;" and so on, ad infinitum... That lady was considered most proficient in euphuism who could keep up longest these chains of similes taken out of fabulous natural history. Alliteration was also a particular ornament of the euphuistic style, as:—"The bavvin, though it burn bright, is but a blaze," but the use of this artifice by Lyly himself was rarely exaggerated; for instances of its excess we have rather to turn to his imitators. In the following passage the typical forms of Euphues, in its pure and original conditions, are so combined and illustrated as to require no further commentary:—"Do we not commonly see that in painted pots is hidden the deadliest poison? that in the greatest repose is the greatest serpent? in the clearest water the ugliest toad? Doth not experience teach us that in the most curious sepulchre are enclosed rotten bones? that the cypress tree beareth a fair leaf, but no fruit? that the ostrich carrieth fair feathers, but rank flesh?—"and so forth. It will be noticed that these characteristics differ in many respects from the specimens of euphues which are most familiar to a modern reader, namely the extravagant speech placed in the mouth of Sir Pierce Shafton in Sir Walter Scott's romance of The Monastery. Scott modelled this character on what he called that "forgotten and obsolete model of folly, once fashionable," Lyly's novel of Euphues, but he had not studied the original to sufficient purpose, and the bombastic ravings of Sir Pierce, who simply talks like a lunatic, have deceived many readers as to the real characteristics of Euphues. Scott betrays his own error when he says that "the extravagance of Euphues... predominates in the romances of Calvénnde and Scordotis," in which it is true that a tinct of pretentious speech is very often found as a language of its own, but that is not the language of Euphues. What Sir Pierce Shafton talks is a mixture of the style of these French romances, with the ostentation of Sir Fopling Flutter and the extravagances of the Scotch translator of Rabelais. But these various sorts of pretentious eloquence have little or nothing in common with the balanced and concealed style of Euphues.

We find that the genuine sort of this kind of superfine conversation was originally called "Euphues," simply, as Overbury speaks of a man "who speaks Euphues, not so gracefully as heartily." The earliest instance of the word "Euphues," which has been traced occurs in a letter, written by Gabriel Harvey in 1592, when he speaks of a man who would be smart, as talking: "a little Euphues." Dekker, in the Cuck's Hornbook of 1603, uses the word as an adjective, and denounces "Euphued gallowglasses." When the practice was going out of fashion we find it thus severely stigmatized by Michael Drayton, a poet who had little sympathy with the artificial refinement of Lyly. In an elegy, printed in 1627, Drayton refers to the merit of Sir Philip Sidney, who recalled English prose to sanity, and did first reduce Our tongue from Lyly's writings then in use, Taling of stones, stars, plants, of fishes, flies, Playing with words and idle similies, As th English apes and very zanies be, Of everything that they do hear and see, So imitating his ridiculous tricks They spake and writ, all like mere lunatics."

This severe censure of Euphues may serve to remind us that hasty critics have committed an error in supposing the Arcadia of Sidney to be composed in the fashionable jargon. That was certainly not the intention of the author, and in fact the publication of the Arcadia, eleven years after that of Euphues, marks the beginning of the downfall of the popularity of the latter. Sidney's prose, it is true, was extremely ornamented, but it was instinct with romantic fancy, and it affected a chivalrous and florid fulness which was artificial enough, but wholly distinct from the more homely elegance of Euphues as we have defined it. The publication of the Arcadia was a severe blow to the Euphuists. Immediately the ladies began to despise the former favourite, and the object at court became, as Ben Jonson noted, to "observe as pure a phrase and use as choice figures in ordinary conference as any be in the Arcadia." But, in the meantime, Lyly had found in Greene, Lodge, Dickenson, Nicholas Breton and others enthusiastic disciples who had learned all the formulas of Euphues, and could bring them forth as
fluently and elegantly as he could himself. Nevertheless the trick wore out, with the taste that it had created, and by the close of the reign of James I. Euphuisim had become a dead language.

Critics have not failed to insist, on the other hand, that a species of Euphuisim existed before Euphues was thought of. It has been asserted that a translation of the familiar epistles, or, as they were called, the "Golden Letters," of a Spanish monk, Antonio de Guevara, led Lyly to conceive the extraordinary style which bears the name of his hero. Between 1574 and 1578 Edward Hellowes (fl. 1550-1600) translated into a very extravagant English prose three of the works of Guevara. Earlier than this, in 1557, Sir Thomas North had published a version of the same Spanish writer's Rotej de Princes (The Dial of Princes), a moral and philosophical romance which is not without a certain likeness in plot, and language to Euphues. It is extremely difficult to know to what extent these translations, which were not strikingly unlike many other specimens of the ornamented English prose of their period, can be said to be responsible for the production of Euphuism. At all events no one can doubt that it was Lyly who concentrated the peculiarities of mannerism, and who gave to it the stamp of his own remarkable talent.

See Landmann, Der Euphuisismus (1881); Arber's edition of Euphues (1896); R. W. Bond's Complete Works of Lyly (1902); Hallam, Jusserrand, S. Lee, passim. (E. G.)

EUPION (Gr. ὑπώπιον, well, still, fat), a hydrocarbon of the paraffin series, probably a pentane, C_5H_{12}, discovered by K. Reichenbach in wood-tar. It is also formed in the destructive distillation of many substances, such as wood, coal, bone, resin and the fixed oils. It is a colourless highly volatile and inflammable liquid, having at 20°C. a specific gravity of 0.65.

EUPOULIS (c. 446-411 B.C.), Athenian poet of the Old Comedy, flourished in the time of the Peloponnesian War. Nothing whatever is known of his personal history. With regard to his death, he is said to have been thrown into the sea by Alcibiades, whom he had attacked in one of his plays, but it is more likely that he died fighting for his country. He is ranked by Horace (Sat. i. 4, 1), along with Cratinus and Aristophanes, as the greatest writer of his school. With a lively and fertile fancy Eupolis combined a sound practical judgment; he was reputed to equal Aristophanes in the elegance and purity of his diction, and Cratinus in his command of irony and sarcasm. Although he was at first on good terms with Aristophanes, their relations subsequently became strained, and they accused each other, in most virulent terms, of imitation and plagiarism. Of the 17 plays attributed to Eupolis, with which he obtained the first prize seven times, only fragments remain. Of these the best known were: the Kolakes, in which he pilloried the spendthrift Callias, who wasted his substance on sophists and parasites; Maricas, an attack on Hyperbolus, the successor of Cleon, under a fictitious name; the Bapthe, against Alcibiades and his clubs, at which prodigate foreign rites were practised. Other objects of his attack were Socrates and Cimon. The Demoi and Poleis were political, dealing with the desperate condition of the state and with the allied (or tributary) cities.

Fragments in T. Kock, Compositorum Atticorum fragmenta, i. (1886).

EUROPUMPS, the founder of the great school of painting which flourished in the 4th century at Sicyon in Greece. He was eclipsed by his successors, and is chiefly remembered for the advice which he is said to have given to Lysippus to follow nature rather than any master.

EURASIAN, a term originally confined to India, where for upwards of half a century it was used to denote children born of Hindu mothers and European (especially Portuguese) fathers. Following the geographical employment of the word Eurasia to describe the whole of the great land mass which is divided into the continents of Europe and Asia, Eurasian has come to be descriptive of any half-castes born of parents representing the races of the two continents. It has further an ethnological sense, A. H. Keane (Ethnology, 1866) proposing to find in the Eurasian Steppé the true home of the primitive Aryan groups.

Joseph Deuiker (Anthropology, 1900) makes a Eurasian group to include such peoples (Ugrians, Turkos-Tatars, &c.) as are represented in both continents. Giuseppe Sergi, in his Mediterranea Race (London, 1901), uses Eurasiatic to denote that variety of man which "brought with it into Europe (from Asia in the later Neolithic period) flexional languages of Aryan or Indogerman type.

EURE, a department of north-western France, formed in 1790 from a portion of the old province of Normandy, together with the countship of Évreux and part of Perche. Pop. (1906) 330,140. Area, 2,330 sq. m. It is bounded N. by the department of Seine Inférieure, W. by Calvados, S.W. by Orne, S. by Eure-et-Loir, and E. by Seine-et-Oise and Oise. The territory of Eure, which nowhere exceeds 800 ft. in altitude, is broken up by its rivers into well-wooded plateaux with a general inclination from south to north. Forests cover about one-fifth of the department. The Seine flows from S.E. to N.W. through the E. of the department, and after touching the frontier at two or three points forms near its mouth part of the northern boundary. All the rivers of the department flow into the Seine,—on the right bank the Andelle and the Epte., and on the left the Eure with its tributaries the Avre and the Iton, and the Risle with the tributary the Charentre. The Eure, from its appearance, takes its name, rises in Orne, and flowing through Eure-et-Loir, falls into the Seine above Pont de l'Arche, after a course of 44 m. in the department. The Risle likewise rises in Orne, and flows generally northward to its mouth in the estuary of the Seine. The climate is mild, but moist and variable. The soil is for the most part clayey, resting on a bed of chalk, and is, in general, fertile and well tilled. The chief cereal cultivated is wheat; oats, colza, flax and beetroot are also grown. There is a wide extent of pastureage, on which are reared a considerable number of cattle and sheep, and especially those horses of pure Norman breed for which the department has long been celebrated. Fruit is very abundant, especially apples and pears, from which much cider and perry are made. The mineral products of Eure include freestone, marl, lime and brick-clay. The chief industries are the spinning of cotton and wool, and the weaving, dyeing and printing of fabrics of different kinds. Brewing, flour-milling, distilling, tanning, cotton-bleaching, cider-making, metal-founding, tanning, and the manufacture of glass, paper, iron ware, nails, pins, wind-instruments, bricks and sugar are also carried on. Coal and raw materials for its industries are the chief imports of Eure; its exports include cattle, poultry, eggs, butter, grain and manufactured goods. The department is served chiefly by the Western railway; the Seine, Eure and Risle provide 87 m. of navigable waterway. Eure is divided into the following arrondissements (containing 36 cantons, 700 communes)—Évreux, Louviers, Les Andelys, Bernay, and Pont-Audemer. Its capital is Évreux, which is the seat of a bishopric of the ecclesiastical province of Rouen. The department belongs to the III. Army Corps and to the académie (educational division) of Caen. Its court of appeal is at Rouen.

Évreux, Les Andelys, Bernay, Louviers, Pont-Audemer, Vernon, Vernon and Gisors are the principal towns of the department. At Gillyon there are remains of a celebrated château of the archbishops of Rouen (see LOUVIERS). Pont de l'Arche has a fine Gothic church, with stained-glass windows of the 16th and 17th centuries; the church of Tillières-sur-Arve is a graceful specimen of the Renaissance style. The churches of Conches (15th or 16th century) and of Ruges (13th, 15th and 16th centuries), and the château of Beaumesnil (16th century) are also of architectural interest.

EURE-ET-LOIR, the central department of north-western France, formed in 1790 of portions of Orléanais and Normandy. Pop. (1906) 273,823. Area, 2,203 sq. m. It is bounded N. by the department of Eure, W. by Orne and Sarthe, S. by Loir-et-Cher, S.E. by Loiré, and E. by Seine-et-Oise. The Perche in the south-west and the Thimerais in the north-west are districts of hills and valleys, woods, lakes and streams. The region of the east and south is a level and uniform expanse, consisting for the most part of the riverless but fertile plain of Beauce, sometimes called
the "granary of France." The northern part of Eure-et-Loir is watered by the Eure, with its tributaries the Vêvre, Blaise and Avre, a small western portion by the Huisne, and the south by the Loir with its tributaries the Conie and the Oznatte. The air is pure, the climate mild, dry and not subject to sudden changes. The soil consists, for the most part, either of clay intermixed with sand or of calcareous earth. North and south the wheat belt extends, while in the west, where the climate is colder, potatoes and flax are the chief crops. Agriculture is better conducted than in most of the departments of France, and the average yield per acre is greater. Cereals occupy half the surface, wheat and oats being chiefly cultivated. Among the other agricultural products are barley, hemp, flax and various vegetables, including good asparagus. Wine is not extensively produced, nor is it of the best quality; but in some parts, especially in the Perche, there is an abundant supply of apples, from which cider is made as the common drink of the inhabitants. The extensive meadows supply pastureage for a large number of cattle and sheep, and the horses raised in the Perche have a wide reputation as draught animals. Bee-farming is commonly prosecuted. The department produces lime, grindstones and brick-clay. The manufactures are not extensive; but there are flour- and saw-mills, tanneries and leather-workers, copper and iron foundries, starch-work, dye-works, distilleries, breweries and potteries; and agricultural implements, cotton and woolen goods, and yarn, hosiery, boots and shoes, felt hats and paper are made. Eure-et-Loir exports the products of its soil and live-stock; its imports include coal, wine and wearing apparel. It is served by the railways of the Western and the Orléans Companies and by those of the state, but it has no navigable waterways. The department has Chartres for its capital, and is divided into the arrondissements of Chartres, Châteaudun, Dreux and Nogent-le-Rotrou (24 cantons and 466 communes). It forms the diocese of Chartres (province of Paris), and belongs to the académie (educational division) of Paris and the region of the IV. Army Corps. Its court of appeal is at Paris.

Chartres, Dreux, Châteaudun, Nogent-le-Rotrou and Anet are the more noteworthy places in the department (g.e.). At Bonneval the lunatic asylum occupies the 18th-century buildings of a former Benedictine abbey. The abbey church belonged to the 13th century, but only a gateway flanked by two massive towers is left. The château of Maintenon dating from the 16th and 17th centuries was presented by Louis XIV. to Madame de Maintenon, by whom additions were made; the aqueduct (17th century) in the park was designed to carry the water of the Eure to Versailles, but was not completed. There is a fine château of the late 17th century, restored in modern times, at Montigny-le-Gannelon, and another of the 13th, 16th and 17th centuries, at one time the property of Sully, at Villebon. St. Lubin-des-Jonctions, one of the churches of this district, is noted for the fine windows of stained glass dating from the 16th century.

**Eureka,** a city, port of entry, and the county seat of Humboldt county, California, U.S.A., on the E. shore of Humboldt Bay. Pop. (1880) 2639; (1890) 4858; (1900) 7327, of whom 2035 were foreign born. It has a good harbour, greatly improved by the National government, and is connected with San Francisco, Portland and other coast ports by steamship lines. In 1909 a railway (the Northwestern Pacific), to connect Eureka with San Francisco, was under construction. The district owes its reputation as a health resort to its equable climate and to the protection afforded by the wide coastal timber belt. Eureka is the principal port for the shipment of redwood lumber, and saw-milling is carried on here on an enormous scale. Several short railways run from Eureka and Arcata (pop. in 1900, 952) across the bay, into the forests, and bring lumber to the mills, most of which are on the Eureka River. Eureka, however, was incorporated in 1853. Eureka was then already the centre of an important lumber trade, principally in spars. It was incorporated in 1856, displacing Union (now Arcata) as the county-seat in the same year.

**Eureka Springs,** a city and health resort, one of the county seats—Bryerville being the other—of Carroll county, in the extreme north-western part of Arkansas, U.S.A., in the Ozark uplift, 1800 ft. above the sea-level. Pop. (1890) 3706; (1900) 3572 (442 of negro descent); (1910) 3288. There is a transient population of thousands of visitors during the year. The city is built picturesquely on the sides of a gulch, down which runs the Missouri & North Arkansas railway. A creek running through the city empties into the White river, only a few miles distant. The surrounding country varies from the wheat belt to rolling prairie. The encircling hills are laden with a covering of pine. The normal mean temperature for the year is about 59° F. (43° F. in winter, 61° F. in spring, 75° F. in summer, and 58° F. in autumn); the average rainfall, about 33 in. The atmosphere is dry and clear. Apart from its share in the agricultural interests of the surrounding region,—devoted mainly to Indian corn, small grains and fruits,—the entire economy of Eureka Springs centres in its medicinal springs, more than forty of which, lying within the corporate limits, are held in trust by the city for the free use of the public. The temperature of the springs varies from about 97° F. to 64° F. Each gallon of their waters contains about 28.5 cub. in. of gaseous matter and from 6 to 9 grains of solids held in solution. The city waterworks are owned by the municipality. The springs have been exploited since 1879, when the first settlement was made. The city was chartered in 1886.

**Euripides** (480-406 B.C.), the great Greek dramatic poet, was born in 480 B.C., on the very day, according to the legend, of the Greek victory at Salamis, where his Athenian parents had taken refuge; and a whimsical fancy has even suggested that his name—son of Euripus—was meant to commemorate the first check of the Persian fleet at Artemisium. His father Mnesarchus was at least able to give him a liberal education; it was a favourite taunt with the comic poets that his mother Clio had been a herb-seller—a quaint instance of the tone which public satire could then adopt with plausible effect. At first he was intended, we are told, for the profession of an athlete,—a calling of which he has recorded his opinion with something like the courage of Xenophanes. He seems also to have essayed painting; but at five-and-twenty he brought out his first play, the *Pelasges,* and thenceforth he was a tragic poet. At thirty-nine he gained the first prize, and in his career of about fifty years he gained it only five times in all. This fact is perfectly consistent with his unquestionably great and growing popularity in his own day. Throughout life he had to compete with Sophocles, and with other poets who represented tragedy of the type consecrated by tradition. The hostile criticism of Aristophanes was witty; and, moreover, it was true, granting the premise from which Aristophanes starts, that the tragedy of Aeschylus and Sophocles is the only right model. Its unfairness, often extreme, consists in ignoring the changing conditions of public feeling and taste, and in condemning the poet for the possibilities, changed accordingly, of an art which could exist only by continuing to please large audiences. It has usually been supposed that the unsparing derision of the comic poets contributed not a little to the life of Euripides at Athens uncomfortable; and there is certainly one passage in a fragment of the *Medea* (Nauck, Frg., 495), which would apply well enough to his persecutors:—

νανιον ἡ τοπολογία τοῦ γέλουσα οὐκ εἶναι ἀποκεκλείται ἀπὸ τοῦ μεταμόρφωσα, στίχοι σαφῶν ἄρη ἀγάλλιον ἕξουσία στὴρατα.

(Roar vain laughter, many exercise
The arts of satire; but my spirit loathes
These mockers whose unbridled mockery
Invades grave themes.)

The infidelity of two wives in succession is alleged to explain the poet's tone in reference to the majority of their sex, and the surrounding country varies from the wheat belt to rolling prairie. He appears to have been repelled by the Athenian democracy, and to have become less the rule of the people than of the mob. Though the son of his day in intellectual matters, he shrank from the coarser aspects of its political and social life. His best word is for the small farmer (ἄτομωργῆς), who does not often come to town, or soil his rustic honesty by contact with the crowd of the market-place.
About 400 B.C. Euripides left Athens, and after a residence in the Thessalian Magnesia repaired, on the invitation of King Archelaus, to the Macedonian court, where Greeks of distinction were always welcome. In his _Archelaus_ Euripides celebrated that legendary son of Temenus, and head of the Temenid dynasty, who had founded Aegae; and in one of the meagre fragments he evidently alludes to the beneficent energy of his royal host in opening up the wild land of the North. It was at Pella, too, that he composed or completed, and perhaps directed, the _Bacchae_. Jealous courtiers, we are told, contrived to have him attacked and killed by savage dogs. It is odd that the fate of Actaeon should be ascribed, by legend, to two distinguished Greek writers, Euripides and Lucian; though in the former case at least the fate has not such appropriateness as the Byzantine biographer discovers in the latter, on the ground that its victim "had waxed rabid against the truth." The death of Euripides, whatever its manner, occurred in 406 B.C., when he was seventy-four. Sophocles followed him in a few months, but not before he had been able to honour the memory of his younger rival by causing his actors to appear with less than the full costume of the Dionysiac festival. Soon afterwards, in the _Frogs_, Aristophanes pronounced the epitaph of Attic comedy on Attic tragedy.

The historical interest of such a life as that of Euripides consists in the very fact that its external record is so scanty—that, unlike Aeschylus or Sophocles, he had no place in the public action of his time, but stood as an artist and a thinker. He has made his Medea speak of those who, through following quiet paths, have incurred the reproach of apathy (φθυριασι). Undoubtedly enough of the old feeling for civic life remained to create a prejudice against one who held aloof from the affrays of the city. Quietness (αγαρωμενοι), in this sense, was still regarded as akin to indolence (ἄγριας). Yet here we see how truly Euripides was the precursor of that near future which, at Athens, saw the more complete divergence of society from the state.

In an age which is not yet ripe for reflection or for the subtle analysis of character, people are content to express in general types those primary facts of human nature which strike every one. Achilles will stand well enough for the young chivalrous warrior, Odysseus for the man of resource and endurance. In the case of the Greeks, these types had not merely an artistic and a moral interest; they had, further, a religious interest, because the Greeks believed that the epic heroes, sprung from the gods, were their own ancestors. Greek tragedy arose when the choral worship of Dionysus, the god of physical rapture, had engrafted upon it a dialogue between actors who represented some persons of the legends consecrated by this faith. The dramatist was accordingly obliged to refrain from multiplying those minute touches which, by individualizing the characters too highly, would detract from their general value. He was at much pains to keep everything consistent, in which all Hellenic humanity could recognize its own image glorified and raised a step nearer to the immortal gods. This necessity was further enforced by the existence of the chorus, the original element of the drama, and the very essence of its nature as an act of Dionysiac worship. Those utterances of the chorus, which to the modern sense are so often platitudes, were not so to the Greeks, just because the moral issues of tragedy were felt to have the same typical generality as those comments themselves.

An unerring instinct keeps both Aeschylus and Sophocles within the limits imposed by this law. Euripides was only fifteen years younger than Sophocles. But, when Euripides began to write, it must have been clear to any man of his genius and culture that, though an established prestige might be maintained, a new poet who sought to construct tragedy on the old basis would be building on sand. For, first, the popular religion itself had every foundation of tragedy—had been unpacked, and secondly, scepticism had begun to be busy with the legends which that religion consecrated. Neither gods nor heroes commanded all the old unquestioning faith. Lastly, an increasing number of the audience in the theatre began to be destitute of the training, musical and poetical, which had prepared an earlier generation to enjoy the chaste and placid grandeur of ideal tragedy.

Euripides made a splendid effort to maintain the place of tragedy in the spiritual life of Athens by modifying its interests in the sense which his own generation required. Could not the heroic persons still excite interest if they were made more real,—if, in them, the passions and sorrows of every-day life were portrayed with greater vividness and directness? And might not the plots be made less of a thrilling plot, especially if taken from the home-legends of Attica? Euripides became the virtual founder of the romantic drama. In so far as his work fails, the failure is one which probably no artistic tact could then have wholly avoided. The frame within which he had to work was one which could not be stretched to his plan. The chorus, the masks, the narrow stage, the conventional costumes, the slender opportunities for change of scenery, were so many fixed obstacles to the free development of tragedy in the new direction. But no man of his time could have broken free from these traditions; in attempting to do so he must have wrecked either his fame or his art. It is not the fault of Euripides if in so much of his work we feel the want of harmony between matter and form. Art abhors compromise; and it was the misfortune of Attic tragedy in his generation that nothing but a compromise could save it. Two devices have become common phrases of reproach against it: _deus ex machina_, the gods' use in the prologue as an argument in the play. In the _Dionysia_, _Deipnosophists_, and the _Bacchae_. The choral songs in Euripides, it may be granted, have often nothing to do with the action. But the chorus was the greatest of difficulties for a poet who was seeking to present drama of romantic tendency in the plastic form consecrated by tradition. So far from censuring Euripides on this score, we should be disposed to regard his management of the chorus as a signal proof of his genius, originality and skill.

Euripides is said to have written 92 dramas, including 8 satyr-plays. The best critics of antiquity allowed 75 as genuine. Nauck has collected 1117 Euripidean fragments. Among these, 1092-1117 are doubtful or spurious; number 448 are from plays of the _Iliad_ title; 4 are from plays of the _Hesiod_ title; 457 represent fifty-five lost pieces, among which some of the best known are the _Andromeda, Antiope_, Bellerophon, _Chrysippen, Erechtheus, Odipus_, _Telemachus_ and _Telephus_.

1. The _Alcestis_, as the didascalus tells us, was brought out in OL. 85-2, i.e. at the Dionysia in the spring of 438 B.C., as the fourth play of a tetralogy comprising 110. _Antigone_, the _Alcestis_ at _Sophocles_, and _Iphigenia_. The _Alcestis_ is altogether removed from the character, essentially grotesque, of a mere satyratic drama. On the other hand, it has features which distinctly separate it from a Greek tragedy of the normal type. First, the subject belongs to none of the great cycles, but to a byway of mythology, and involves such strange elements as the servitude of Apollo in a mortal household, the rape of the fates that Admetus must die on a fixed day, and the restoration of the dead Alcestis to life. Secondly, the treatment of the subject is romantic and even fantastic,—strikingly so in the passage where Apollo is directly confronted with the daemonic figure of Thanatos. Lastly, the boisterous, remorseful, and generous Heracles makes, not, indeed, a satyratic drama, but a distinctly satyratic scene—a scene which, in the franc original, hardly bears the full weight of the _Deipnosophists_ in general. Browning, that Heracles got drunk in order to keep up other people's spirits. When the happy ending is taken into account, it is not surprising that some have called the _Alcestis_ a tragi-comedy. But we cannot so regard it. The slight and purely incidental strain of comedy is but a moment of relief between the tragic sorrow and
Euripides

terror of the opening and the joy, no less solemn of the conclusion. In this respect the Alcestis might more truly be compared to such a drama as the Winter’s Tale; the loss and recovery of Hermione by Leontes do not form a tragic-comedy because we are amused between, while the story of the Alcestis is a tragedy. Euripides, it has not been seen that the Alcestis—the earliest of the extant plays—may represent an attempt to substitute for the old satyr-drama an after-piece of a kind. Wherever preserving a satyric element, should standearer to tragedy. The Alcestis is one which was perhaps more of the merely grotesque entertainment that old usage appended to the tragedies; just as, in the sphere of comedy, we know from Aristophanes that they were tiring of their buffoonery. An original dramatist may have seen an opportunity here. However that may be, the Alcestis has a peculiar interest for the history of the drama. It makes in the most natural manner, if perhaps, at the same moment, that great movement which began with Euripides,—the movement, of transition from the purely Hellenic drama to the romantic.

Medea was brought out in 431 B.C. with the Philoctetes, the Didyas, and a lost satyr-play called the Reapers (Theristai). Euripides gained the third prize, the first falling to Euriphoron, the son of Hymettos, and 420 B.C. in the work of an obscure predecessor, Neophron, at least he made the subject thoroughly his own. Hardly any play was more popular in antiquity with readers and spectators, with Heraclides, to have Medea in the play and adapted it. We do not know how far it may have been used by Ovid in his lost tragedy of the same name; but it certainly inspired the most elaborate of Sophocles’ tragedies may be called, bridging the interval between Euripides and modern adaptations. We may grant at once that the Medea of Euripides is not a faultless play, and that the dramatic potentialities between the two plays are happily conceived; that the murder of the children lacks an adequate dramatic motive; that there is something of a moral anti-climax in the arrangements of Medea, before the deed, for her personal safety. But the death of Iphicles is a tragedy of Medea in history; and his death is available for the splendid force with which the character of the strange and strong-hearted woman, a barbarian friendless among Hellenes, is constructed. The background of Medea’s life in Corinth is one of the most fruitful sources of dramatic intrigue. For its place in the chronological order there are no data except those of style and metre. Judging by these, Hermann would place it “neither after Oed. 89, nor before 410 B.C.—i.e. before the Sicilian Expedition. This may be taken as approximately correct. The scene is laid throughout on the temple of Delphi. The young Ion is a priest in the land of his birth and of his powers. It is his story, and Etechbos, chief of the race of Erechtheus, come to inquire of the god concerning their childlessness; and it is discovered that Ion is the son of Creusus by the god Apollo. Athena herself appears, and commands that Ion shall be brought up on the throne of Delphi, and spring the four Attic tribes, the Telentses (priests), Hoplotes (fighting-men), Argadeis (husbandmen) and Askaleis (heralds). The Delphic choral plays have been effective on the Athenian stage not only by its situations, but through its appeal to Attic sympathies. 7. The Suppliants, who give their name to the play are Argive women, the mothers of Argive warriors slain before the walls of Thebes, who, led by Admetus, king of Argos, come as suppliants to the altar of Demeter at Eleusis. Creon, king of Thebes, has refused burial to their dead sons. The Athenian king Thebes demands of Creon that he shall grant the funeral rites; the refusal is followed by a battle in which the Thebans are vanquished, and the bodies of the Argive dead are then brought to Eleusis. At the close of the Athenian appears, and ordains that a close alliance shall be formed between Athens and Argos. Some refer the play to 417 B.C., when the democratic party at Athens rose against the oligarchs. But a more probable date is 420 B.C., when, through the agency of Athens and Argos, Athens and Argos concluded a treaty of alliance, and the play has a strongly marked rhetorical character, and is, in fact, a panegyric, with an immediate political aim, on Athens as the champion of human rights against the tyrants. 8. The Helen; a companion piece to the Suppliants, and of the same period—is decidedly inferior in merit. Here, too, there are direct references to contemporary history. The defeat of Athens by the Spartans in 418 B.C. strengthened the Argive party who were in favour of discarding the Athenian for the Spartan alliance (Thuc. v. 76). In the Heracleidae, the sons of the dead Heracles, Eurystheus, are received and sheltered at Athens. Thus, while Athens is glorified, Sparta, whose kings are descendants of the Heracleidae, is reminded how unnatural would be the alliance between herself and Athens (Thuc. v. 407). 9. The Helenae Massamenoei (Hercules Furens), which, on grounds of style, can scarcely be placed later than 420—417 B.C., shares with the other plays the purpose of exciting Athens in the person of Theseus. Heracles returns from Hades—whither, at the command of Eurystheus, he went to bring back Cerberus—just in time to save his wife Megara and his children from being put to death by Lycus of Argos, whom he has offered to give his consent to the death of his own brother. At the deed, he is suddenly stricken with madness by Lyssa (Fury), the daemonic agent of his enemy the goddess Hera, and in his frenzy he kills both his wife and daughter. The signal is a play which has itself been sacrificed by the Greeks to the shade of Achilles. The two calamities which befall Hecuba have no direct connection with each other. In this sense the play lacks unity of design. On the other hand, there is a certain parallelism of pathos with which the poet seeks to surround the central figure of Hecuba. The drama illustrates the skills of which Euripides, while failing to satisfy the requirements of poetic rhetoric, could sustain interest by an ingeniously woven plot. It is a representative Inquisitivistisch, and well exemplifies the peculiar power which Euripides ascribed to himself and to the later tragedians that nothing of the kind. 1

1 (Originally simply Heracles, the addition Massamenoei being due to the Aldine ed.)
10. Iphigenia among the Tauri, which metre and diction mark as one of the later plays, is also one of the best—excellent both in the management of a romantic plot and in the delineation of character. The scene is laid at the temple of Artemis in the Taurian Chersonese (the object is said of them in the modern Tauri, Iphigenia, who had been doomed to die at Aulis for the Greeks, had been snatched from that death by Artemis, and had become priestess of the goddess. The Taurian Artemis is here humanized, and human habits and fashions are imitated. Two strangers, who had landed among the Tauri, have been sentenced to die at the altar. She discovers in them her brother Orestes and his friend Pylades. They plan an escape, are recaptured, and are finally delivered by the goddess. The Chersonese Aulis, which commands Thoas, king of the land, to permit their departure. Iphigenia, Orestes and Pylades return to Greece, and establish the worship of the Chersonese Artemis at Aulis and Hera. The drama of Euripides necessarily suggests a comparison with that of Goethe; and many readers will probably also feel that, while Goethe is certainly not inferior in fineness of ethical portraiture, he has the advantage in his mastery of material to dramatise. But his drama certainly is not just to Euripides to remember that, while his competitor had free scope of treatment, he, a Greek dramatist, was bound to the more rigid limits of the Attic worship.

11. The Troades appeared in 415 B.C. along with the Alexander, the Polymedes, and a satyr-play, the Sisyphus. It is a picture of the miseries endured by noble Trojan dames—Hecuba, Andromache, Cassandra—immediately after the capture of Troy. There is hardly a plot in the proper sense—only an accumulation of sorrows on the heaped misfortunes, suffering, and the regular sequel of a less a day's work of moving and pathetic spectacle, closing with the crash of the Trojan towers in flame and ruin. The Troades is indeed remarkable among Greek tragedy as an attempt to approach the dramatic character of many of the scenes thus observed, and must be observed that there is no ground for the inference—sometimes made an accusation against the poet—that the choral passage, v. 794, was intended to encourage the Sicilian expedition, sent forth by Athens in 415 B.C. As Euripides wrote his tragedy in the Aetna over against Cartagine (v. 220) speaks of it as "renowned for the trophies of prowess"—a topic, surely, not of encouragement but of a man's honor.

12. The Helena—produced, as we learn from the Aristophanic scholia, in 412 B.C., the year of the lost Andromache—is not one of its author's efforts. It is an attempt to substitute for the Trojan myth, first adopted by Stesichorus in his Palinodie—that is, the witch of Helen passed to Troy, while the real Helen was detained in Egypt. In this play she is rescued from the Egyptian king, Thoas, by her own palace slave, Memelaus, and who, after her escape, found safety in Greece. The Trojan element thus engrafted on the Greek myth is more than fantastic: it is well-nigh grotesque. The comic poets—Pindar, Aristophanes in the Thespis, in the Phoenissae—felt this; nor can we blame them if they ridiculed a piece in which the mode of treatment was so discordant with the spirit of the ancient tragedians; and so irreconcilable with all that constituted the higher meaning of tragedy.

13. The Phoenissae was brought out, with the Oeumaios and the Creticas, in 411 B.C., the year in which the recall of Alcibiades was one of the prominent events. It is the story of the self-sacrifice of the Trojan הנמר, ratified by the Assembly at Athens (Thuc. viii. 81, 97). The dialogue between the gods and Polybeus in the obscure of banishment (v. 147, v. 469, v. 533) has a certain emphasis which certainly looks like an allusion to the trial of Aeschylus. The subject of the play is the same as that of the Aeschylean Seven against Thebes—the war of succession in which Argos supported Polybeus against his brother Epaminondas. The Phoenician maidens who form the chorus are imagined to have been on their way from Tyrus to Delphi, where they were destined for service in the temple, when they were detained at Sicyon by the outburst of the war—a device which affords a contrast to the Aeschylean chorus of Theban elders, and which has also a certain fitness in view of the legends connecting Thebes with Phoenicia. But Euripides has hardly been successful in the rivalry in which he has even pointed, or for the use of allusions—with Aeschylus. The Phoenissae is full of brilliant passages, but it is rather a series of effective scenes than an imposing dramatic effect.

14. Plutarch (Lys. 15) says that, when Athens had surrendered to Lyons (404 B.C.), and when the fate of the city was doubtful, a Phocian officer happened to see at a banquet of the leaders the first song of the chorus in the Electra—Euripides—

*αὔγαμονος ὦ θάρα, Σίθων, Ἡλέκταρα, τοὶ σὺν ἁγρότοις ἀλῆς, and "whom they heard it, all were touched, so that it seemed a choral song of the famous once among the number of such men." The character of the Electra, in metre and in fiction, seems to show that it belongs to the poet's latest years. If Müller were right in referring to the Sicilian expedition the closing passage in which the Electra declare that they fast "to the Sicilian sea to save ships upon the deep" (v. 1347), then the play could not be later than 415 B.C. But it may with more probability be placed somewhere in the time of the Peace or perhaps in or about the year 410 B.C. No play of Euripides has been more severely criticized. The evidence is evident. The Choeaphori of Aeschylus and the Electra of Sophocles appear to invite a direct comparison with this drama. But, as R.C. Jebb suggested, such criticism as that of Schlegel should remember that works of art are not meant to be compared, however good they may be, however much in which they represent a common basis. It is surely unmeaning to contrast the elaborate homeliness of the Euripidean Electra with the simplicity and adherence to the dramatic method of the Electra. But this is fundamentally the same, may be profitably compared; Euripides interprets another conception, and must be tried by other principles. His Electra is not a miracle, a daring experiment, a play which is a demonstration of what is possible with the old principles, but a play which is a demonstration of what is possible with the new. It has the same fatal effect as Electra's attempt to kill her mother and Hera—not to kill the king in the end, but in both cases to try. The characters of the Electra, in the same way, are the same as in the Electra. The Electra of Sophocles is a tragedy of passion, but the Electra of Euripides is a tragedy of passion. And the Electra of Sophocles is a tragedy of passion in which the final achievement of their deliverance, is both too involved and too inconsequent for a really tragic effect. Just as in the Electra, in the Electra, the Electra, in the Electra, the Electra, the Electra, the Electra, the Electra, the Electra.
The Bacchae was always an exceptionally popular play—partly because its opportunities as a spectacle fitted it for gorgeous representation, and, consequently, it was recommended for performance at court and on great public occasions. "Demetrius the Cynic" (says Lucian, Adr. Indoctum, 19) "saw an illiterate person at Corinth reading a very beautiful poem—the Bacchae of Euripides, I think it was; he was so moved at the reading of the doom of Agave, and the murder of her son, and the deed of Agave. Demetrius snatched the book from him and tore it up, saying, 'It is better for Pentheus to be torn up at once by the hand that reads over and over again by you.'"

18. The Cyclops, of uncertain date, is the only extant example of a satiric drama. The plot is taken mainly from the story of Odysseus and Polyphemus in the 9th book of the Odyssey. To be realized that the poet should have a fresh feeling for the nature of the art parodied. It is because Euripides was not in accord with the spirit of the heroic myths that he is not strongly stamped with any of the tragedies—such as those of the Elektra and the Orestes—had, in their several ways, contributed to destroy the meaning of satiric drama. They had done gravely very much what satiric drama aimed at doing grotesquely. They had made the heroic persons act and talk like ordinary men and women. The finer side of such parody had lost its edge; only broad comedy remained.

The Bacchae is held by some to be what the didascalla and the grammarians call it—a work of Euripides; and Paley has ably supported this view. But the scepticism first declared by Voltaire, that Euripides is now almost universally recognized as spurious. The art and the style, still more evidently the feeling and the mind, of Euripides are absent. If it cannot be given to a disciple of his merely ascribed school, it is still less like the work of an Alexandrian. The most probable view seems to be that which assigns it to a vernier of small dramatic power in the latest days of Attic tragedy. It has this literary interest, that it is the only Attic drama which the subject of which, directly taken from Homer, Iliad, of which the tenth book—the Andreas—has been followed by the playwright with a closeness which is sometimes mechanical.

When the first protests of the comic poets were over, Euripides was secure of a wide and lasting renown. As the old life of Athens passed away, as the old faiths lost their meaning and truth and freshness, Aeschylus and Sophocles might cease to be fully enjoyed save by a few; but Euripides could still charm by qualities more readily and more universally recognized. The comparative nearness of his dictation to the idiom of ordinary life rendered him less attractive to the grammarians of Alexandria than authors whose erudite form afforded a better scope for the display of learning or the exercise of ingenuity. But there were two aspects in which he engaged their attention. They loved to trace the variations which he had introduced into the standard legends. And they sought to free his text from the numerous interpolations which even then had resulted from his popularity on the stage. Philochorus (about 360–350 B.C.), best known for his Attica, dealt, in his treatise on Euripides, especially with the mythology of the plays. From 300 B.C. to the age of Augustus a long series of critics busied themselves with it. The most famous of these, the earliest of which, in an attempt to revivify his reputed works is ascribed to Dicaearchus and Callimachus in the early part of the 3rd century B.C. Among those who furthered the exact study of his text, and of whose work some traces remain in the extant scholia, were Aristophanes of Byzantium, Callistratus, Apollodorus of Tarsus, Timachidas, and pre-eminent Diodymus; probably also Crates of Perugamum and Aristarchus. At Rome Euripides was early made known through the translations of Ennius and the few almost unknown of Pacuvius. When Hellenic civilization was spread through the East, the mixed populations of the new settlements welcomed a dramatic poet whose taste and whose sentiment were not so severely or exclusively Attic. The Parthian Orodes and his court were witnessing the Bacchae of Euripides when the Agave of the hour was suddenly enabled to lend a ghastly reality to the terrible scene of frenzied triumph by displaying the gory head of Niobaeus. Modern Macedonians, as one in which the power of Rome and the genius of Greece were simultaneously absorbed in the presence of sul Khan. 'So far as Euripides is concerned, the incident may suggest another and a more pleasing reflection; it may remind us how the charm of his human genius had penetrated the recesses of the barbarian East, and had brought to rude and fierce peoples at least some dim and distant apprehension of that gracious world in which the

great spirits of ancient Hellas had moved. A quaintly significant testimony to the popularity of Euripides is afforded by the Byzantine Chrestos patmos. This drama, narrating the events which preceded and attended the Passion, is a cento of no less than 2610 verses, taken from the plays of Euripides, principally from the Bacchae, the Troades and the Rhene. The traditional authorship of the authorship of the 16th chapter, generally rejected; another conjecture assigns it to Apollinaris of Laodicea, and places the date of composition at about A.D. 330. Although the text used by the author of the cento may have not have been a good one, the value of the piece for the diplomatic criticism of Euripides is necessarily very considerable; and it was diligently used both by Valckenaer and by Porson.

Dante, who does not mention Aeschylus or Sophocles, places Euripides, with the tragic poets Anchiphon and Agathon, and the lyrists Simonides, in the first circle of Purgatory (xxii. 106), among those

Greci, che già di lauro ornar la fronte.

Casaubon, in a letter to Scaliger, salutes that scholar as worthy to have lived at Athens with Aristophanes and Sophocles—a compliment which certainly implies respect for his correspondent's powers as a peacemaker. In popular literature, too, where the works of his masters were as yet little known, the 16th and 17th centuries testify to the favour bestowed upon Euripides. G. Gascoigne's and Francis Kinwelmen's Jocasta, played at Grey's Inn in 1566, is a literal translation of Lodovico Dolce's Giocasta, which derives from the Phoenixes, probably through the Latin translation of R. Winter (Basel, 1541). Among early French translations from Euripides may be mentioned the version of the Iphigenia in Tauris by Thomas Sibilet in 1544, and that of the Hebrus by Bouchet in 1550. About a century later M. de Brosses gave the world his Aristogiton, his Phedre, and his Phedre; and many have held that, at least in the last-named of these, "the disciple of Euripides" has excelled his master. Bernhardy notices that the performance of the Hippolytus at Berlin in 1851 seemed to show that, for the modern stage, the Phedre has the advantage of its Greek original. Racine's great English contemporary seems to have known and to have liked Euripides better than the other Greek tragedians. In the Reason of Church Government Milton certainly speaks of "those dramatic constitutions in which Sophocles and Euripides reign;" in the preface to his own drama, again, he joins the names of Aeschylus, Sophocles and Euripides, "the three tragic poets unequalled yet by any." But the Samson Agonistes itself clearly shows that Milton's chief model in this kind was the dramatist whom he himself has called—as if to suggest the skill of Euripides in the delineation of pathetic women—"sad Electra's poet," and the idiosyncrasy of this special dramatic art is clearly shown in the two great Euripidean monodies. In the second half of the 18th century such men as J. J. Winckelmann (1717–1768) and G. E. Lessing (1729–1781) gave a new life to the study of the antique. Hitherto the art of the old world had been better known through Roman than through Greek interpreters. The basis of the revived classical taste had been Latin. But now men gained a finer perception of those characteristics which belong to the Greek work of the great time, a fuller sense of the difference between the Greek and the Roman genius where each had its best, and generally a clearer recognition of the qualities which distinguish ancient art in its highest purity from modern romantic types. Euripides now became the object of criticism from a new point of view. He was compared with Aeschylus and Sophocles as representatives of that ideal Greek tragedy which ranges with the purest type of sculpture. Thus tried, he was found wanting; and he was attacked on the side of the moderns with as much vigour as if he were his best, but no critic approached A. W. Schlegel (1767–1845) in severity of one-sided censure. Schlegel, in fact, will scarcely allow that Euripides is tolerable except by comparison with Racine. L. Tieck (1773–1853) showed truer appreciation for a brother artist when he

1 (According to Karl Krummacher, Gesch. der byz. Lit., it is an 11th-century production of unknown authorship.)
EUROCLYDON—EUROPA

described the work of Euripides as the dawn of romantic poetry haunted by dim yearnings and forebodings. Goethe—who, according to Berhardy, knew Euripides only "at a great distance"—certainly admired him highly, and left an interesting memorial of Euripidean study in his attempted reconstruction of the lost Phæthon. There are some passages in Goethe's conversations with Eckermann which form effective quotations against the Greek poet's real or supposed detractors. To feel and realize the personality, one must be something more than a reader. All those who denied the sublime to Euripides were either poor wretches incapable of comprehending such sublimity or shameless charlatans who, in their presumption, wished to make more of themselves than they were. "A poet whom Socrates called his friend, whom Aristotle lauded, whom Alexander admired, and for whom Sophocles and the city of Athens put on mourning on hearing of his death, must certainly have been some one. If a modern man like Schlegel must pick out faults in such a great an ancient, he ought only to do it upon his knees" (J. A. Symonds, Greek Poets, i. 230). We yield to no one in admiration of Goethe; but we cannot think that these rather bullying utterances are favourable examples of his method in aesthetic discussion; nor have they any logical force except as against those—if there be any such—who deny that Euripides is a great poet.

One of the most striking of modern criticisms on Euripides is the sketch by Mommsen in his history of Rome (bk. iii. ch. 1). In it, O. Mommsen less than others among the Euripides scholars. But it indicates, with true historical insight, his place in the development of his art, the operation of those external conditions which made him what he was, and the nature of his influence on succeeding ages.

The manuscript tradition of Euripides has a very curious and instructive history. It throws a suggestive light on the capricious nature of the process by which literary treasures have been saved or lost. Nine plays of Euripides were selected, probably in early Byzantine times, for popular and educational use. Some of the literary treasures have been saved or lost. Nine plays of Euripides were selected, probably in early Byzantine times, for popular and educational use. Some of them were lost, others were saved. The last certainly, in its own kind, by far the most splendid work of Euripides that we possess. Had these three plays been lost (as some say), it is not to be supposed that the estimate of Euripides must have been decidedly lower. But all the ten plays not included in the select list had a narrow escape of being lost, and, as it is, have come to us in a much less satisfactory condition.

A. Kirchhoff was the first. In his editions, thoroughly to investigate the text and the Byzantine copies of the medieval manuscript MSS. The MSS. are the texts, derived from at least a baroque of the 9th or 10th century, which contained the nineteen plays (counting the Rhesus) now extant. From this archetype a copy also, lost, was made about A.D. 1100, containing only the nine select plays. This copy became the source of all our MSS. for those plays. They are—(1) Marcius 471, in the library of St Mark at Venice (12th century); (2) Vaticanus 909, 12th century; nine plays; (3) Paribar 31712, 13th century, 7 plays (all but Troades and Rhesus). Of the same stock, but inferior, are (4) Marcius 460, 13th century; (5) Osius Pteron; (6) Novarius (from Hafnia, Copenhagen, according to Paley), a late transcript from a MS. resembling Vat. 909, nine plays. A second family of MSS., which have eight plays, survives as a Byzantine recension of the 13th century, is greatly inferior.

The other ten plays have come to us only through the preservation of two MSS., both of the 14th century, and both ultimately derived, as Kirchhoff thinks, from the archetype of the 9th or 10th century. These are (1) Palatino 387, Kirchhoff's B, usually called the Byzantine, Med., Rht., Hipp., Al., Troad., and seven others—Bacchae, Cyclops, Heracleides, Supplices, Thm., Iphigenia in Tauris, Iphigenia in Tauris; and (2) Palatino 281, 18 play copies of the Trojan. Of these two MSS., is the only one for the Helena, the Electra, and the Hercules Furens. By far the greatest number of Euripidean MSS. contain only three plays—the Hecuba, Orestes and Phoenissae,—these having been chosen out of the select nine for school use—probably in the 14th century.

It should be remembered that, as a selection, the nine chosen plays of Euripides correspond to those seven of Aeschylus and those seven of Sophocles which alone remain to us. If, then, these nine did not include the Iphigenia in Tauris, the Ion or the Bacchae, may we not fairly conclude that the last two plays of the other two dramatists' complete works at least equal to any that have been preserved? May we not even reasonably doubt whether we have received those masterpieces by which we should be some one of our philosopher Creon, whom the Venetians had named as bishop of Monemvasia, but whom the Greeks had refused to recognize—at Venice in 1534. The scholia on the Trojan and Rhesus were first published by L. Dindorf (1821). The first and best edition is that of W. Dindorf (1863). The collection, though loaded with rubbish—including worthless analyses of the lyric metres by R. Porson, etc. and the work of Dr. R. Porson, a first in 1800). Orestes, Iphigenia in Tauris, Iphigenia in Tauris, Helena, Ion, Hercules Furens, C. Badham (1854-1855), Iphigenia in Tauris, Hecuba, Ion; H. Well, Hesp., Medea, Iph. in T. Iph. in A., Electra, Orestes [and ed.]. It is impossible to cite a list of the best editions of single plays, but mention may be made of the Bacchae, by J. E. Sandys (4th ed., 1900) and R. Y. Tyrell (1892); Medea, by A. W. Ventris (1881); Iphigenia in Phocea, by J. P. Mahaffy (1881); and of the Hercules Furens, by Wilamowitz-Möllendorff (2nd ed., 1895), with a comprehensive introduction on the literature of Euripides. A selected list (up to 1806) will be found in J. B. Mayor's "Genius and the Choice of Classical Books"; see also N. Wecklein in C. Buxian's Jahrbihe, xxxviii (1897), and for the earlier literature W. Engelmann, "Scriptores Graeci" (1841). The little volumes on Euripides published by B. C. Yeats (1906). The "Classics for English Readers" will be found generally useful. See also P. Decharrue, Euripide et l'esprit de son siècle (1853); A. W. von Schrader, Euripides et les poètes de l'Ancien Régime (1855); N. J. Patin, Étude sur Euripide (1872); O. Ribbeck, Euripides und seine Zeit; and (for the life of the poet) Wilamowitz's ed. of the Hercules Fures (i. 1-42; P. Masqueray, "Hermes" ii. 1895, 1896.).

Modern Complete Editions.—W. Dindorf (1819, in Poet. Sceni, ed. 5); A. Kirchhoff (1855, ed. min. 1867); F. A. Puley (2nd ed. 1872-1880), with commentary; P. Nauck (1880-1897, Textscher series); G. G. Murray in Oxford Scriptorum Classicorum bibliotheca (1902, foll.).

English Translations.—Among these may be noted the complete verse translation by A. S. Way (1894-1898). That in prose by E. P. Coleridge (1896); and G. G. Murray's verse translation (1902-1905). A literary interest attaches to Robert Browning's "Fraud 1557," a translation of his Bacchanales, the "prehistoric" of Euripides' lost Phæthon in the 1840 edition of his works, vol. xxxiii. pp. 22-43.

EUROCLYDON (Gr. ἐκβολή, cast wind, ἔκβολος, wave), a stormy wind from the N.E. or N.N.E. in the eastern Mediterranean. Where the Authorized Version of the Bible (Acts xxvii. 14) mentions euroclydon, the Revised Version, taking the reading more accurately, has euromos or north-east wind. The word is sometimes used for the Bora (p. 89.).

EUROPA (or rather, EUPHROPA), in Greek mythology, according to Homer (Iliad, xiv. 321), the daughter of Phoenius or, in a later story, of Agenor, king of Phoeacia. The beauty of Europa fired the love of Zeus, who approached her in the form of a white bull and carried her away from her native Phoenicia to Crete, where...

1 See also a clear account in the preface to vol. iii. of Paley's edition.

2 New ed. by E. Schwartz (1887-1891).
she became the mother of Minos, Rhadamanthys and Sarpedon. She was worshipped under the name of Hellotia in Crete, where the festival Hellotia, at which her bones, breathed in myrtle, were carried round, was held in her honour (Athenaeus xv. p. 678). Some consider Europe to be a moon-goddess; others explain the story by saying that she was carried off by a king of Crete in a ship decorated with the figure-head of a bull. O. Gruppe (De Cadmi Falsa, 1867) endeavours to show that the myth of Europe is only another version of the myth of Persephone.

See Apollodorus iii. i.; Ovid, Metam. ii. 889; articles by Helbig in Roscher’s Lexicon der Mythologie, and by Hild in Darenberg and Sauter’s antike antiken. References in the articles and in the art (archaic metope from Pireos) represent the journey of Europe over the sea on the back of the bull.

**EUROPE**, the smallest of those principal divisions of the land-surface of the globe which are usually distinguished by the conventional name of continents.

1. Geography and Statistics

It has justly become a commonplace of geography to describe Europe as a mere peninsula of Asia, but while it is necessary to bear this in mind in some aspects of the geography of the continent, more particularly in relation to the climate, the individuality of the continent is established in the clearest manner by the course of history and the resultant distribution of population. The earliest mention of Europe is in the Homeric Hymn to Apollo, but there Europe is not the name of a continent, but is opposed to the Peloponnesus and the islands of the Aegean. The distinction between Europe and Asia is found, however, in Aeschylus in the 5th century B.C., but there seems to be little doubt that this opposition was learnt by the Greeks from some Asiatic people. On Assyrian monuments the contrast between assur, "the land of the rising sun," and erz or iriz, "the land of darkness" or "the setting sun," is frequent, and these names were probably passed on by the Phoenicians to the Greeks, and gave rise to the names of Asia and Europe. Where the names originated the geographical distinction was clearly marked by the intervention of the sea, and this intervention marked equally clearly the distinction between Europe and Libya (Africa). As the knowledge of the world extended, the difficulty, which still exists, of fixing the boundary between Europe and Asia where there is land connexion, caused uncertainty in the application of the two names, but never obscured the necessity for recognizing the distinction. Even in the 3rd century B.C. Europe was regarded by Eratothenes as including all that was then known of northern Asia. But the character of the physical features and climate finally determined the fact that we know as Europe came to be occupied by more advanced countries, another, but separated on the east by unpeopled or very sparsely peopled areas from the countries of Asia, and the boundary between the two continents has long been recognized as running somewhere through this area. Within the limits thus marked out on the east and on other sides by the sea, the climatic conditions are such that inhabitants are capable of and require a civilization of essentially the same type, based upon the cultivation of our European grains. 

Those inhabitants have had a common history in a greater measure than those of any other continent; and hence are more thoroughly conscious of their dissimilarities from, than of their consanguinity with, the peoples of the east and the south.

On the subject of the boundaries of Europe there is still divergence of opinion. While some authorities take the line of the Caucasus as the boundary in the south-east, others take the line of the Manych depression, between the upper end of the Sea of Azov and the Caspian Sea, nearly parallel to the Caucasus. Various limits are assigned to the continent on the east. Officially the crest of the Caucasus and that of the Urals are regarded in Russia as the boundaries between Europe and Asia on the south-east and east respectively, although in neither case does the boundary correspond with the great, administrative divisions, and in the Ural it is impossible to mark out any continuous crest. Reclus, without attempting to assign any precise position to the boundary line between the two continents, makes it run through the relatively low and partly depressed area north of the Caucasus and east of the Urals. The Manych depression, marking the lowest line of this area to the north of the Caucasus, has been taken as the boundary of Europe on the south-east by Wagner in his edition of Guthke’s Lehrbuch der Geographie, and the same limit is adopted in Kirchhoff’s Länderkunde des Erdkreises Europe and Stanford’s Compendium of Geography and Travel. In favour of this limit it appears that much weight ought to be given to the consideration put forward by Wagner, that from time immemorial the valleys on both sides of the Caucasus have formed a refuge for Asiatic peoples, especially when it is borne in mind that this contention is reinforced by the circumstance that the steppes to the north of the Caucasus must interpose a belt of almost unpeopled territory between the more condensed populations belonging undoubtedly to Asia and Europe respectively. Continuity of population would be an argument in favour of assigning the whole of the Urals to Europe, but here the absence of any break in such continuity on the east side makes it more difficult to fix any boundary line on the very edge of Asia. Hence on this side it seems reasonable to attach greater importance to the fact that the Urals form a boundary not only orographically, but to some extent also in respect of climate and vegetation, and on that account to take a line following the crest of the different sections of that system as the eastern limit between the two continents. Obviously, however, any eventual agreement among geographers on this head must be more or less arbitrary and conventional. In any case it must be borne in mind that, whatever conventional boundary be adopted, the use of the name Europe as so limited must be confined to statements of extent or implying extent. The facts as to climate, fauna and flora have no relation to any such arbitrary boundary, and all statistical statements referring to the countries of Europe must include the part of Russia beyond the Urals up to the frontier of Siberia. In such statements, however, in the present article the whole of the lieutenantcy of the Caucasus will be left out of account. As to extent it is provisionally advisable to give the area of the continent within different limits.

The following calculations in English square miles (round numbers) of the area of Europe, within different limits, are given in Behm and Wagner’s Bevölkerung der Erde, No. viii. (Gottha, Justus Perthes, 1887), p. 53—Europe, within the narrowest physical limits (to the crest of the Urals and the Manych depression, and including the Sea of Azov, but excluding the Caspian Steppe, Ireland, Norway, Zealand, and Great Britain (‘Bear Island’)), 3,570,000 sq. m. The same, with the addition of the Caspian Steppe up to the Ural river and the Caspian Sea, 3,687,730 sq. m. The same, with the addition of the area between the Manych depression and the Caucasus, 3,790,530 sq. m. The same, with the addition of territories east of the Ural Mountains, the portion of the Caspian Steppe east of the Ural river as far as the Emba, and the southern slopes of the Caucasus, 3,880,730 sq. m.

Boundaries.

At the summit of each of the Trans-Ural railways (Perm-Tyumen and Ufa-Chelyabinsk) and that of the road across the Caspian (from Vladikavak to Tiflis), is a point from which, in the clearest manner, the name Europe on one side, Asia on the other, mark this boundary.

*Griesbach, on the strength of Miidendorff’s observations, remarks that, in addition to European fruit trees, oak, maple, elm, ashes and the black alder do not cross the Urals, while the lime tree is reduced to the size of a shrub (La Végétation du globe, travel to Asia, 1811)*.

*On the history of the boundary: between Asia and Europe see F. G. Hahn in the Mitteilungen des Vereins für Erdkunde zu Leipzig (1881), p. 85-104. Hahn, on the basis that true nomad systems must be regarded as forming geographical units, pronounces against the practice of making "natural boundaries" run along mountain crests, and assigns the whole of the Caucasus region to Europe as all belonging to such a system, but geographically quite different from the Armenian plateau (p. 103). But surely it is less different from the European plain.*
EUROPE

908

GEOGRAPHY

3.088,500 sq. m. The same, with Iceland, Novaya Zemlya, Spitsbergen and Bear Island, 4,093,000 sq. m. In all these calculations the islands of the Sea of Marmora, the Canary Islands, Madeira, and even the Azores, are excluded, but all these Greek islands of the Aegean Sea and the Turkish islands of Thasos, Lemnos, Samothrace, Imbros, Hagiostri or Zobba, and even Tenedos, are included. The point of the mainland area is Cape Nordkyn in Norway, 71° 6' N—its southern, Cape Tarifa in Spain, in 36° 0' N; its most western, Cape da Roca in Portugal, 9° 20' W; and its most northern, the north end of the Ural Mountains, in 66° 20' E. A distance from Cape St Vincent in Portugal to the Ural Mountains near Ekaterinburg has a length of 3,293 m., and finds its centre in the Vistula. From the mouth of the Kama to the mouth of the Ural river the direct distance is 1,600 m., but the boundary line has a length of 2,400 m.

The two of the most striking features in the general conformation of Europe are the great number of its primary and secondary peninsulas, and the consequent exceptional development of its coast-line—an irregularity and development which cannot be accounted for from the laws of its history. The total length of coast-line was estimated by Reusch in 1869 at 19,830 m., of which about 3,600 were counted as belonging to the Baltic, 8,310 to the Black Sea, 4,020 to the Atlantic, and 3,230 to the Black Sea and Mediterranean. This estimate, however, does not take into account minor indentations. Reclus's estimate, which is not more than 20,000 m., and the estimate of Strelbitsky up to 47,790 m. (smaller islands not included), or 1 m. of coast for about 75 sq. m. of area. Rohrbach 1 calculated the mean distance of all points in the interior of Europe from the coast, as compared with the coast of America, the continent which ranks next in this respect. It must be pointed out, however, that such calculations are apt to be very misleading, as the coast-line value of the really extensive can depend not merely on the existence of natural harbours or the presence of facilities for the construction of artificial harbours, but also on the presence of natural facilities for communication between such harbours and a productive interior.

The consideration just mentioned gives great significance to the fact that while the coast-line of Europe is in its general features very much the same as it was at the beginning of the historic period, it has undergone a number of important local changes, some at least of which are due to causes that are at work over very extensive areas. These changes may be conveniently classified under four heads: the formation of deltas by the alluvium of rivers; the increase of the land-surface due to upheaval; the advance of the sea by reason of its own erosive activity; and the advance of the sea through the subsidence of the land. The actual form of the coast, however, is frequently due to the simultaneous or successive action of several of these causes, and the rivers, the land, and the sea forces help or resist each other. That changes in the coast-line on the shores of the Gulf of Bothnia have taken place within historical times through elevation of the land seems now to be generally admitted. The independence of land and water is seen by Malmberg on the Finland side of that gulf gained about 24 sq. m. between 1784 and 1894, an amount greater than could be accounted for by the most liberal estimate of wave erosion, and it seems that the greatest part of this increase in land seems now to be generally admitted. The independence of land and water is seen by Malmberg on the Finland side of that gulf gained about 24 sq. m. between 1784 and 1894, an amount greater than could be accounted for by the most liberal estimate of wave erosion, and it seems now to be generally admitted that on the Swedish coast of that gulf a rise has taken place in recent years on the east coast of Sweden from about 57° 20' N, increasing in amount towards the north up to 62° 20' N, where it reaches an average of about two-fifths of an inch annually. 2

Our information is naturally most complete in regard to the Mediterranean coasts, as these were the best known to the first book-writing nations. There we find that all the great rivers have been success- fully at work—more especially the Rhone, the Ebro and the Po. The activity of the Rhone, indeed, as a maker of new land, is astonishing. The delta, erected on the southern point of the Apennines by the Po, and towards of four miles inland; the city of Arles is said to be nearly twice as far from the sea as it was in the Roman period. The present St Gilles was probably a harbour which the Greeks founded. The delta advances at least two metres or about 7 ft. annually; and it requires great labour to keep the harbour of Corte being silted up. The Po is even more efficient than the Rhone, and in the size of its basin, which was at one time an insular city like Venice, has now a wide stretch of downes partly covered with pine forest between it and the sea. Aquileia, one of the greatest seaports
1 Petersmanns Mitteilungen (1890), p. 91.
in the Lipari group, have been familiarly known from the earliest historic times; but the fourth has only attracted particular attention since the 18th century. It lies in the Archipelago, on the southern coast of the Cyclades, near the little group of islets called Santorini. The region was evidently highly volcanic at an earlier period, for Milo, one of the nearest of the islands, is simply a ruined crater still presenting some vestiges of lava, and other traces of former activity. The devastations produced by the eruptions of the European volcanoes are usually confined within very narrow limits; and it is only at intervals that the part of the continent is visited by a real formidable earthquake. The only part of Europe, however, for which there are no recorded earthquakes is central and southern Russia, and the Carpathians, especially the Carpathian area of depression, Greece, Italy, especially Calabria and the adjoining part of Sicily, the Sierra Nevada and the Pyrenees, the Lisbon district and the rift valley of the upper Rhine (between the Jura and the Black Forest) are all regions specially liable to earthquake shocks and occasionally to shocks of considerable intensity. One well-marked seismic line extends along the south side of the Aetna from La Villette island to Görs and Fiume, and another forms a curve towards the south-east passing first through Calabria, then through the north-east of Sicily to the south of the Peloritani Mountains. Of all European earthquakes in modern times, the most destructive are that of Lisbon in 1755, and that of Calabria in 1883; the devastation produced by the former has become a classical instance of such disasters in popular literature, and by the latter it is said to have lost its lives. Calabria again suffered severely in 1865, 1870, 1894, 1905 and 1908.

If the European mountains are arranged according to their greatest elevation, as in the Swiss, they have their highest peaks above 15,000 ft.; (2) the Sierra Nevada, the Pyrenees, and Etna, about 11,000 ft.; (3) the Apennines, the Corsican Mountains, the Carpathians, the Balkans, and the Dinaric Alps, from 8,000 to 9,000 ft.; (4) the Iberian Peninsula, the Scandinavian Alps, the Dinaric Alps, the Greek Mountains, and the Cevennes, between 6,000 and 8,000; (5) the mountains of Auvergne, the Pyrenees, the mountains of Sardegna Major, Minorca, and the Crimea, the Black Forest, the Vosges, and the Scottish Highlands, from 4,000 to 6,000 ft.

The following estimates are based on those contained in the fifth edition of Dr. Gemma Wagner's Lehrbuch der Geographie. In the original the figures are given in German sq. m. and in sq. kilometres in round numbers, and the equivalents here given in English sq. m. are similarly treated:

referred to not only have more or less well-marked breaks between them, but are themselves so notched by passes and cut by transverse valleys as to present great facilities for crossing in proportion to their average altitude. The first and second of these points have special importance, because to the relation between these temperatures at different seasons of the year. These groups are rivers flowing from glaciars, in which the temperature is warmer than the air in winter, colder in summer; rivers flowing from lakes, characterized by peculiarly high winter temperatures, in consequence of which the mean temperature for the year is always above that of the air; rivers flowing from springs, which, at least near their sources, are more rapidly cooled by low than warmed by high air temperatures; and rivers of the plains, which have a higher mean temperature than the air in all months of the year.

From the table given on p. 900 (col. 1) it will be seen that the most extensive and highest land areas of Europe, as far as Scandinavia, which has a general trend from south-west to north-north-east, and is completely detached by seas and plains from the highland area to the south. There are other completely detached highlands and islands, which are only connected by a low-lying straining in the middle of Germany, formed by a well-marked gap, existing easy communication between the valley of the Rhine and the lower part of that of the Meuse, the Rhine spreading northwards and then north-eastwards till they join the Vosges, but sink in elevation towards the north-east and flow in several narrow, east. East of the Vosges the Rhine valley forms an important trough running north and south through the highlands of western Germany. The central plain between the Alps and the Pyrenees, which lies in a country of less than 1000 ft. in elevation, the well-known Burgundy Gap or Gap of Belfort, constitutes a well-marked break between those mountains and the Jura, and establishes easy communication between the Rhine and the Strasburg Gap. The latter gap is the clearest manner the highlands of central France from both the Alps and the Jura, while between these last systems there lies the middle lands containing south-westwards to a narrow but important gap at the outlet of the Lake of Geneva. Between the Rhone valley and the mountains of Switzerland, Italian, and Balkan peninsula the orographical lines of demarcation are less distinct, but on the north the valley of the Danube mostly forms a wide separation between the Alps and the mountains of the Balkan peninsula on the south and the highlands of Bohemia and Moravia, the Carpathians, and the Transylvanian Alps on the north. The valleys of the Eger and the Elbe form distinct breaks in the environment of Bohemia, and the Szeks on the south. The highlands of Bohemia and Moravia are even more clearly divided from the Carpathians by the valley of the upper Oder, the Moravian Gate, as it is called, which forms the northern line of communication between the south-east of Russia and Vienna.

An estimate has been made by Strelbitsky of the length and of the area of all of the principal rivers of Europe. The table given in the table on p. 900 the estimates given without any special authority are based on Strelbitsky's figures, but it should be mentioned that the estimates of length made by him evidently do not take into account minor windings, and are consequently less than those given by others. The authorities are separately cited for the originals of all other figures given in the table.1

1 In other parts of this work areas of rivers-basins and lakes, and other measurements, may be in conflict, but it is not possible to resolve such differences in toilet. Various authorities naturally differ, both in methods of estimating and in standards of precision.

The observations on the temperature of European rivers have been collected and discussed by Dr Adolf E. Forster.2 He finds that the dominant factor in determining that temperature is the temperature of the air above, but that rivers are divisible into four groups with respect to the relation between these temperatures at different seasons of the year. These groups are rivers flowing from glaciers, in which the temperature is warmer than the air in winter, colder in summer; rivers flowing from lakes, characterized by peculiarly high winter temperatures, in consequence of which the mean temperature for the year is always above that of the air; rivers flowing from springs, which, at least near their sources, are more rapidly cooled by low than warmed by high air temperatures; and rivers of the plains, which have a higher mean temperature than the air in all months of the year.

The Danube and its tributaries, the great rivers of Germany, above all eastern Germany, and those of Italy, are also notorious for their inundations. In southern Europe, where the summers are nearly rainless, most of the rivers disappear altogether in respect to the season. For many European lakes, especially the smaller ones, estimates have been made of the mean depth and the volume. A list of all the European lakes for which the altitude, extent, and greatest depth could be ascertained, compiled by Dr K. Peucker, is published in the Geog. Zeitsehrift (1886), pp. 666-666, where estimates of the mean depth and the volume are also given when there is need of them. The table given above, comprising only the larger lakes, is mainly based on this list, where the original authorities are mentioned. The figures entered in the table not taken

3 Including L. Paskov as well as the connecting arm known as Teploye.
from this list are after Strehblatsky, the *Glog. Universtelle* of V. de St Martin, or, in the case of Swedish lakes, from the official handbook of Sweden.

The Alps, the Pyrenees, and the Alps, break up into a southern and northern subdivision—the former consisting of the Lago Maggiore, and the lakes of Lugano and Como, Lago d'Iseo, and Lago di Garda, all connected by a system of canals, and now extended further still toward the west by a system of waterways from Geneva threaded by the Rhone, Lake Constance, Zurich, Neuchâtel, Biel and other Swiss lakes belonging to the basin of the Rhine, and a few of minor importance belonging to the Danube. The 4th, 5th, 6th, and 7th, are, in fact, a single lake, which is as large in some respects as the most remarkable system of lakes in the continent—the Pinno-Russian, which comprises at least three times as many lakes as Switzerland. There are systems of irregular basins formed in the surface of a granitic plateau. In Finland proper they occupy no less than a twelfth of the total area. The lakes of South Sweden are very similar in form. The Neusiedler Lake, for example, the (Pieno Lacos of the Latins and Ferro-tava of the Hungarians), completely dried up in 1693, 1738 and 1864, and left its bed covered for the most part with a deposit of salt.4 Lakes Copais in Against a book or other heavy object lying upon it. How the lateral or tangential pressures originated is still matter of controversy, but the usually accepted explanation is as follows. The interior of the earth is subject to compressions more rapidly than the exterior, and, if no other change took place, the outer crust would be left as a hollow sphere without any internal support. But the materials of which it is composed are not strong enough to bear its enormous weight, and, in consequence, an enormous pressure is exerted against the interior core. Where the crust is rigid it fractures, as an ordinary arch would fracture; and some portions fall inward, while others may be beaded to a watertight chamber. On the other hand, the crust is made of softer rock, it crumples and folds, and a mountain chain is produced. Such a mountain chain, for want of a better term, is called a folded mountain chain. But this is not the most intense where a flexible portion of the crust lies next to a more rigid part. Where the folding has occurred, the rocks which were once comparatively soft become hard and rigid, and the next series of wrinkling will usually be formed beyond the limits of the old one. This is what has happened in the European area.

The oldest mountain chain lay in the extreme north-west of Europe, and its relics are seen in the outer Hebrides, the Lofoten Islands and the north of Norway. The rocks of this ancient chain have since been converted into gneiss, and they were folded and denuded before the deposition of the oldest known layer on them. The mountain system must therefore have been formed in Pre-Cambrian times, and it has been called by Marcel Bertrand the Huronian chain. It is probable that a great land-mass lay towards the north, but in the Alps, which certainly existed south-east of the chain, the Cambrian, Ordovician and Silurian beds were interpolated. In Russia and South Sweden these beds still lie free. The coast chains in North Norway and the north of Ireland they were crushed against the north-western continent and were not only intensely folded but were pushed forward over the old rocks of the Huronian chain. Thus was formed the Caledonian mountain system of Úd. Sues, in which the folds run from south-west to north-east. It was raised at the close of the Silurian period.

Then followed, in northern Europe, a continental period. By the elevation of the Caledonian chain the northern land-mass had grown large, and the whole land, and the whole land, of the Old Red Sandstone was laid down in inland seas or lakes, while farther south contemporaneous deposits were formed in the open sea.

During the earlier part of the Carboniferous period the sea spread over the southern shores of the northern continent; but later the whole area again became land and the Coal Measures of northern England and Scotland were laid down. Towards the end of this period the third great mountain chain was formed. It lay to the south of the Scottish Caledons, and its northern margin stretched from Germany to the Baltic. The oldest part of this, the East German, and the south of Belgium, and was continued round the Harz and the ancient rocks of Bohemia, and possibly into the south of Russia. It is along this northern margin, where the folded beds have been laid upon the surface of the slate, that the Devonian and Carboniferous deposits of Dover and of Belgium occur. The general direction of the folds is approximately from west to east; but the chain consisted of two large parts, that between the waters which covered northern Europe and those which lay over the eastern and the Variscian. The two areas together, which were undoubtedly formed at the same period, have been named by Bertrand the Hercynian chain. Everywhere the chief folding seems to have been in the Lower Carboniferous, which we may term the Upper Carboniferous, which lie unconformably upon the folded older beds. The Hercynian chain appears to have been of considerable thickness, for the Middle Carboniferous measures of the north and Portugal are thrown into folds which have the same general direction and which were formed at approximately the same period. Both the Upper Carboniferous and the Lower Carboniferous folds are buried beneath more recent deposits and have in some cases been marked by the superposition of a later series of folds.

The formation of this Carboniferous range was followed in northern Europe by the second continental period somewhat similar to that of the Old Red Sandstone, but the continent extended still farther to the north. The Permian and Triasiasic deposits of England and Germany, which are purely marine Titonian formation, with its peculiar fauna was deposited at this time, while the Chalk was formed in northern Europe, the Hippurite limestone was laid down in the south.

Subsequent changes in the geography of Europe. The formation of the great mountain ranges of the south, the Alpine system of the Alps, perhaps began at an earlier date, but it is the Tertiary period that marked the final elevation of the range. The Alps and the European ranges were formed during the Tertiary period, and the depression of the areas seems to be closely connected with the elevation of the neighbouring mountain chains. Exactly what was happening in northern Europe at the time of great changes in the south it is not easy to say. The basaltic lavas of the north of Ireland, the western islands of Scotland, the Faeroe Islands, and the west coast are those of the Tertiary period. No sign of marine Tertiary deposits of earlier age than Phocene has been found in this northern part of Europe, and on the other hand the rare sandstone beds are interbedded with the basalts. It is probable, therefore, that in northern Europe a great land-mass lay to the north-west of Europe, over which the basalt lavas flowed, and that the formation of this part of the Atlantic and perhaps of the North Sea did not take place until the Miocene period.

At a later date the climate, for some reason which has not yet been fully explained, grew colder. The ice sheets formed over a large part of the northern part was covered by a great ice-sheets which extended southward nearly as far as lat. 50° N., and has left its marks over the
whole of the northern part of the continent. With the final melting and disappearance of the snow, the topographic of the continent assumed nearly its present form, and man came upon the scene. Minor changes, such as the separation of Great Britain from the continent, occurred at a later date; but since the Glacial period there have, apparently, been no fundamental modifications in the configuration of Europe.

The elevation of each of the great mountain systems already described is affected by erosion by water, by weathering by expansion of volcanic rocks, and the sequence appears to have been similar in every case. The volcanoes of the Mediterranean are the last survivors of the great eruptions which accompanied the elevation of the Alpino-Piemontain system.

In western Europe by far the most prevalent wind is the S.W. or W.S.W. It represents 25% of the annual total; while the N. is only 6%, the N.E. 8, the E. 9, the S. 13, the W. 17 and the N.W. 11%. The summer total is approximately 22%, while the N. is 9, N.E. 8, E. 7, S.E. 7, W. 21 and N.W. 17%.

In southern Europe, on the other hand, the prevailing winds are from the N. and E.—the E. having the preponderance in winter and at sea. Of local winds the most remarkable are the fohn, in the Alps, distinguished for its warmth and dryness; the Rotenturm wind of Transylvania, which has similar characteristics; the bora of some parts of southern France; the etesian winds of the Mediterranean; and the sirocco, which proves so destructive to the southern vegetation.

Though it is only at comparatively rare intervals that the winds above described attend at a burning rate destructive to property which they occasion, both sea and land, is in the aggregate of no small moment. About six or seven storms from the west produce every winter a certain amount of destruction in the southern districts, such as Switzerland or the Adriatic, than in the northern districts, as Scotland and Denmark.

The remaining factors of the climate of Europe are these:

The northern borders of the continent are within the Arctic Circle; the most southern points of the mainland are 35º or more north of the Tropic of Cancer; to the east extends for about 2000 miles a continuous land surface from Asia; in the east, the Bering Sea and the Sea of Okhota, which lie the waters of the North Atlantic, which penetrate in great inland seas to the north and south of the great European peninsula; the prevailing winds in western Europe are already stated as the south-westerly; and the arrangement of the highlands is such as to allow of the penetration of winds with a westerly element in them directly from the interior of the continent. These are not distinguishing influences. They affect the climate of Europe in the same manner as they do that of any other land surface in the same latitudes.

The remaining factors, however, are of the highest importance. It is in them that Europe owes in a very large measure those physical conditions which are the basis of its recognition as a separate continent. In estimating the value of these factors, one must bear in mind, first, that the waters of the north Atlantic are exceptionally warm, especially on the European side of the ocean. The Gulf Stream carries a large body of warm water northward to the north of the Grand Banks of the Gulf of St Lawrence, and to the latitude of 50º N. The winds of the Gulf Stream prevailing south-westerly winds, especially during the winter months, drift onwards to the western and northern shores of Europe, carrying with them bodies of water of exceptionally high temperature. Secondly, one must bear in mind that these relatively high temperatures over the ocean promote evaporation and the presence of relatively large amounts of water-vapour in the air over those parts of the ocean which adjoin the continent; and, thirdly, that, as the winds are the sole means of carrying water-vapour from one part of the earth's surface to the other, and the sole means of carrying heat and cold from the ocean to the land, the prevailing south-westerly winds are allowed by the superficial configuration to bring a relatively high rainfall and a relatively large amount of heat in winter to land farther inland than in any corresponding latitudes. During the summer the winds referred to have a cooling effect, but not to the same degree as those which tend to raise the temperature. From the point of view just indicated the only part of the world that is fairly comparable with Europe is the west of North America; but, as there the outline and superficial configuration are quite different, the ocean influences are not so pronounced as in the north-west coast of Europe, and the climate resembles that of the South of Europe, as far as the contiguity of the Atlantic with the Mediterranean and that of the Mediterranean with the Atlantic, which are the chief characteristic features of the climate of Europe.

On the local distribution of rainfall and temperature, the physical configuration of the country has very little influence. Here as elsewhere there is a striking difference both in the amount of rainfall and the temperature on the weather between the sea and the highlands, on the sea and the land. But with reference to this it should not be forgotten that water-vapour, heat and cold may be carried farther into the land by winds blowing in a different direction from that of those by which they were introduced from the ocean. The water-vapour may be brought out by different winds from those by which the water-vapour was brought to the area in which it is deposited. The water-vapour may be driven over a mountain by a northerly or easterly wind, and thus cause rain on the northern or eastern side of the mountain. Still, any rainfall map of Europe, even considering the nearly equal density of the areas of the rainfall, will show that the west-south-westerly wind may be driven against a mountain side by a northerly or easterly wind, and thus cause rain on the northern or eastern side of the mountain. Still, any rainfall map of Europe shows that the rainfall, at least in the south, is considerably less in the middle of the country than at the seacoast.

The amount of the snowfall as distinguished from the rest of the precipitation is now coming to be recognized as an important physical characteristic of the European continent. European countries in which a record of the snowfall is kept is Russia, but it may be pointed out that the scantiness of the winter precipitation and accordingly of snow in the south-east of Europe is almost entirely due to the prevailing dry air which is thus left without the protective blanket enjoyed in some other parts of the world with cold winters.

An important subject in connection with the distribution of the rainfall of Europe has received attention from Drs. A. J. Herbertson, Köppen and Supan, and Mr. A. Angot. The rainfall of each month in Europe as in the other continents is shown by Dr. A. Herbertson in The Distribution of Rainfall over the Land. On plate 19 of the Atlas of Meteorology, by J. G. Bartholomew and A. J. Herbertson, Dr. Köppen has furnished maps showing the west and north-westerly winds from which the precipitation in Europe is derived; on plate 12, the temperature of the three years, 1861-1890, are recorded and discussed. The first paper (1833, B. p. 155-159) deals with the rainfall of the United Kingdom, the second (1833, B. p. 155-159) with western Europe (from about 45º to 58º N. and about east as about 9º to 21º E.). Both papers are accompanied by maps showing by six tints the mean rainfall for each month as well as for the year; and that on western Europe, set out on a scale, in the west as far south as Avila, the proportion of the rainfall occurring during the winter, spring, autumn and summer months respectively. But the most instructive maps show the subject embracings the whole of Europe are four maps prepared by Dr. Supan to show the percentage of the total rainfall of the year occurring in the winter, summer, autumn and winter respectively. From the maps it appears that all the southern and western coasts of Europe have a high proportion of rain in autumn, and that this is true also of the western part of the Italian peninsula and the islands of the western half of the Mediterranean Sea, including the Peloponnesus, of the Sénèze-Rhone valley and both sides of the Gulf of Bothnia, and that a high winter rainfall is characteristic of the extreme south-west of Ireland and of the north-west of Ireland and the Iberian peninsula, as well as of the greater part of the Mediterranean region, but more particularly in the south-east, while in this region, and, again particularly in the south-east, there is a deficiency of summer rains which is obvious from the fact that the highest percentage in the interior and eastern parts of the continent. If the year be divided into a winter and summer half, the area with a predominance of summer rains begins in the east of Great Britain and extends to the Baltic.

1. Voevoldwskij, as quoted by Voevodk, Die atmosphärische Circulation.

2. Plate in Petermanns Mitteilungen (1905).

4. London, 1901 (one of the publications of the Royal Geog. Soc.)

5. Plate 21 in Petermanns Mitteilungen (1900).
and extends eastwards, while the Mediterranean region generally is one of rainfall in the winter and relatively dry summers. The reason for this is that with similar conditions of soil and superficial configuration the Mediterranean region is agriculturally much less productive, except where there are regions of irrigated, or where the corresponding latitudes in the east of Asia and the east of North America, where there are corresponding summer temperatures but an opposite seasonal distribution of rainfall.

The occurrence of the seasonal distribution of rainfall may be noticed the prevalence of sunshine and cloud. The map accompanying König's paper on the duration of sunshine shows a decrease from west to east. Outside of the peninsula, and except for regions near the sea, and of the south-east of Europe, there is an increase from north-west to south-east (Orkney Islands, 1145 hours = 26% of the total possible; Sulina, 2411 hours = 55%). In the Mediterranean peninsulas the duration is everywhere great: Greece, 2970 hours, the west and the north of the Italian peninsula 2906 hours. Dr. P. Effert's map illustrating cloud-distribution in central Europe embraces the region from Denmark to the basin of the Arno, and from the Pyrenees to the Alps and the Rhine. The temperature of the continent has been illustrated by Dr Supan in an interesting series of maps based on actual observations not the temperature of the periods within which the mean daily temperature varies within certain limits (at or below 32° F.; 50°-68° F.; above 68° F.). The first of these maps strikingly illustrates the effect of the temperature on the crops of a particular region. It shows how the region of the Mediterranean Sea as well as the protection afforded to the Mediterranean countries against cold winds and waves by the barrier of mountains and seas, is paralleled by 60° there is no cold land in the west of Europe where the average daily temperature is at or below the freezing point for as much as one month, and in the Mediterranean region the only higher parts of which are above the northern limit of the Mediterranean Peninsula are characterized by such prolonged frosts. On the other hand, on the parallel of 50° N. the duration of such low temperatures increases quite rapidly, afterwards, as the one rises gradually, to the north, and by far the greater part of the continent south of 53° N. has at least six months within those limits, and south of 55° five months. It is shown that the high temperatures which it illustrates are prolonged for a month or more throughout the Mediterranean region, but outside of it, and anywhere except in the Rhine valley and the south-east of France. The Rhone valley and a large area in the south-east of Russia. Without doubt an important cause of the prolonged duration of high temperatures in this last area is the relatively long duration of sunshine, which is already mentioned as shown by König's map to be characteristic of south-eastern Europe.

Mention should here be made also of Brückner's remarkable treatise on the climate of Bulgaria. It is accordingly interesting to note that these variations with such variations over the entire land-surface of the globe, a large proportion of the area of Europe, for which continent, according to the great number of peculiarities with regard both to the secular variations in temperature, rainfall, the date of the vintage, the frequency of cold winters, the level of rivers and lakes, the duration of the ice-free period of rivers (in this case all Russian, and other rivers in the middle zone in Russia), and other phenomena, is in nearly every respect a peculiar interest. They apply to 29 stations in France, south-west Germany and Switzerland, and for one station (Dijon) go back with few exceptions to year 1391; and as the variations of which they give an indication correspond precisely to the indications derived from temperature and rainfall in those periods in which we have corresponding data for these meteorological elements, they may be taken as warning conclusions with regard to those points even for periods for which direct data are wanting. A period of early vintages corresponds to one of comparatively scanty rains and high temperature. It is accordingly interesting to note that the data referred to indicate, on the whole, for Dijon an earlier vintage for the average of all periods of five years down to 1435 than for the period of the years 1800-1860; but that the figures generally show no regular retardation from period to period, but more or less regular oscillations, differing in their higher and lower limits, and presenting different periods of long duration.

Much light has been thrown on the present state of agriculture in Europe by the publication of Engelbrecht's Landbaus Systemen der Cultivated pflanzen. 1 Of the two chief bread-plants wheat and barley, wheat is cultivated as far north as about 65° N. both in Norway and Finland, but the limit of the area in which more wheat is cultivated than rye to the west and north exceeds that of wheat and rye, west and far north, as to about 65° N. of both in Norway and Finland, and the limit of the area in which more wheat is cultivated than rye to the west and north exceeds that of wheat and rye, west and far north, as to about 65° N. in the west to about 46° N. in the Ural. On one side of this line wheat makes up more than 90% of the entire grain area 1 in western Russia, in Italy, and in large parts of the south-east of France and the south-east of England. Spelt is cultivated in the south-west of Germany, Belgium and northern Switzerland, on the middle Volga, and on the borders of the south of the south-east of England, and in a great part of Denmark and Schleswig-Holstein. Barley is more largely cultivated than oats both in the extreme north and the south of the continent. Maize is cultivated to a great extent in the north-west of the Iberian Peninsula, in the south-west of France, in northern Italy and in the lands bordering the lower Danube; in the south-east of France and in the south of Germany. It is cultivated only by all grain crops. Millets (various species of panicum) are more extensivly cultivated in the south-west of Europe. The kind of millet known as guinea-corn or duurra (Sorghum vulgare Pers.), has been extensively cultivated in the open fields in India and in the southern provinces of Russia. The potato is very largely cultivated in western, northern and central Europe, but has comparatively little progress in Russia. The cultivation of lentils is mostly large in the west and south-west, and in central Europe, but has comparatively little progress in Russia.
the Spanish coast and in Sicily, and appears less frequently in southern Italy and Greece.

Special interest attaches to the two main bread crops of Europe, wheat and rye, the average annual production of which in the different countries of the continent is shown in the following tables.

### Average Production of Wheat in Millions of Bushels.

Perhaps the most striking facts revealed by these two tables are these; first, that the United Kingdom is the only great wheat-growing country which has shown a great decline in the amount of production in two successive periods; and, second, that both Germany and Russia show a great advance under both wheat and rye between the last two periods. This gives interest to statistics of acreage under these two crops, and some data under that head are given in the adjoining tables.

</table>

Horse-breeding is a highly important industry in almost all European countries, and in several, as Russia, France, Hungary, and Spain, the state gives it exceptional support. Almost every district of the continent has a breed of its own: Russia reckons those of the Bashkirs, the Kalmyks, the Don-Cossacks, the Estonians and the Finlanders as among its best; France sets store by those of Flanders, Picardy, Normandy, Limousin.
and Austria; Germany by those of Hanover, Oldenburg and Mecklenburg, which are indeed rank among the most powerful in the world; and Great Britain by those of Suffolk and Clydesdale. The English racers are famous throughout the world, and Iceland and the Faroe Islands are also well known for their hardy breed of diminutive ponies. The ass and the mule are most abundant in the southern parts of the continent, more especially in Spain, Italy and Greece. The camel is not a popular companion of the European animal, but it is extensively used in Russia, in the provinces of Orenburg, Astrakhan and Taurid, in Turkey on the Lower Danube, and in Spain at Madrid and Cadiz; and it has even been introduced into Tuscany. A much more important beast of burden in eastern and southern Europe is the ox: the long lines of slow-moving wains in Rumania, for example, are not unlike what one would expect in Cape Colony. In western Europe it is used for the pulling of heavy loads, and in Portugal and the southern parts of Spain it is taken as the extreme in point of size, and the "Durhams," and "Devonshires" of England as examples of the reared breed. The Duroc breed ranks very high in the production of milk. The buffalo is frequent in the south of Europe, more especially in the countries on the Lower Danube and in southern Italy. Sheep are of immense economic value to most European countries, above all to Spain and Portugal, Great Britain, France, Hungary, the countries of the Balkan Peninsula, the Baltic provinces of Germany, and the south-east of Russia. The local breeds are more numerous than in the case of the horse and the development of remarkable breeds quite as wonderful. In all the more mountainous countries the goat is abundant, especially in Spain, Italy and Germany. The pig is distributed throughout the whole continent, but it does not go so high a place as in Siberia. In the rearing and management of poultry France is the first country in Europe, and has a great surplus of both fowls and eggs. In Pomerania, Brandenburg, West Prussia, Mecklenburg and Württemberg the breeding of geese has become a great source of wealth, and the town of Stralsund is famous all the world over for its pâles de foie gras. Under this heading may also be mentioned the domesticated insects, the silkworm, the bee and the silkworm is extensively reared in northern Italy, but also in the southern parts of the Rhone valley in France, and to a smaller extent in several other Mediterranean and southern countries. Bee-keeping is widespread. The carthius is largely reared in Spain, but also in other countries in southern and central Europe.

**Minerals.**

The most important mineral products of Europe are coal and iron ore. In order of production, the leading coal-producing countries have long been Great Britain, Germany, France and Belgium. Since 1897 Russia has held the fifth place, followed by Austria-Hungary, Spain and Sweden. The production of coal is distributed throughout the countries in question. Besides lignite, iron ore is produced in great amount in Germany and Austria-Hungary, and to a small amount in France, Italy and a few other countries. Down to 1895 the United Kingdom stood first among the iron-ore producing countries, but since 1896 and order under that time, it has been the German Customs' Union, the United Kingdom, Spain, France, Russia, Sweden, Austria-Hungary and Belgium. By far the most important iron-producing district of Europe is that which lies on different slopes of the hills in which German Lorraine, the grand duchy of Luxembourg and France meet, the district producing all the ore of Luxemburg and the principal supplies of Germany and France. Another important producing district is that which is known as the Siegerland on the confines of the Prussian provinces of the Rhine and Westphalia. Next in importance to these are the iron-ore deposits of the United Kingdom, the chief being those of the Cleveland district south of the Tees, and the hematite fields of Cumberland and Furness. Thus the Scotch Islands and the mineral production of Europe generally, perhaps the most notable fact to record is the relatively lower place taken by the United Kingdom in the production both of coal and iron. Here it is enough to state the main results. In the production of coal the Kingdom is in about 4th place among European countries, but notwithstanding the fact that the British export of coal has been increasing much more rapidly than the production, the country has not been able to keep pace with Germany and Russia in the rate of increase of production. In 1878 the production of coal in the German empire was only about 34% of that of the United Kingdom, but in 1906 it had grown to 50%. It was exclusive of the whole of its production of which in Germany is increasing still more rapidly. It was equal to little more than one-fourth of the coal production in 1878, but more than two-fifths in 1906. The coal production of Russia (mainly European Russia) is still relatively small, but it is increasing more rapidly than that of any other European country. While in 1878 it was little more than 2 1/2% of that of the United Kingdom, in 1906 the corresponding ratio was above 6%. In the production of iron ores the decline in the position of the United Kingdom is much more marked. The production reached a maximum in 1882 (18,023,000 tons) and since then it has sunk in one year (1893) as low as 11,200,000 tons, while, on the other hand, since 1893 there has been an increase of the production of such ores in the German Zollverein (including Luxemburg), France, Spain, Sweden and Russia, down to 1900, with a more progressive movement, in spite of fluctuations, in all these countries than in the United Kingdom. In the total amount of production the United Kingdom in 1905 took the second place. While in 1878 the production of iron ores in the German Zollverein was about one third of that of the United Kingdom in 1905 it exceeded that of the United Kingdom by nearly 60%.

An indication of the relative importance of different European countries in the production of ores and metals of less aggregate value than coal and iron is given in the following table:—

M.t. = metric tons.

Platinum has hitherto been obtained nowhere in Europe except in the auriferous sands in the Russian government of Perm. Nickel is derived from Germany, Norway and Sweden; antimony from Germany and Hungary; bismuth from Saxony and Bohemia. Bauxite, which is used in the manufacture of aluminium, is obtained from France, Styria and Ireland. In order of importance the chief salt-producing countries are the United Kingdom (in which for some years the amount produced has been for the most part stationary or declining), Germany (which is rapidly increasing its production), Russia, France, Spain, Italy, Austria-Hungary, Rumania and Switzerland. Besides common salt Germany has for many years been producing a rapidly increasing amount of potash salts of which it has almost a monopoly. Italy (chiefly Sicily) is by far the most important producer of saltpetre.

---

2. Production in the Ural districts only.
3. See note 11.
4. A considerable quantity of quicksilver is produced in the government of Ekaterinoslav.
5. Dressed.
6. Cuprous pyrites and cuprous iron pyrites, besides which a considerable quantity of copper precipitate is produced.
7. A small quantity of copper ore is produced in Finland, but the bulk of the Russian production is in the Asiatic provinces.
8. A country has been able to keep pace with Germany and Russia in the rate of increase of production.
9. In 1906 Germany produced 12,908 m.t. of argentiferous pig lead.
10. Of which 158,424 m.t. argentiferous.
11. Zinc and lead ore.
12. In addition to 28,891 m.t. of calcined zinc ore.
important producer of sulphur. Among other mineral products may be mentioned the boric acid and strontium marble of Tuscany, the statuary marble of Greece, the asphalt of Switzerland, Italy, Germany and Austria-Hungary, the slate of Wales, Scotland and France, the kaolin of Germany, England and France, and the abundant and glass sands of Belgium, France and Bohemia.

With regard to commerce, industries and railways, as a whole, Europe is divided into two regions, one of which is characterized by a large proportion of mining at the expense of agriculture.

With few exceptions the countries of Europe that export coal and iron are also smelting regions of Germany from an early date, and are now being built on a much larger scale in the Rhine region and other parts of the country. In all periods the Baltic and the North Sea, have been a centre of trade and commerce.

The commercial history of Europe has illustrated from the earliest times the influence of the climate and geographical features in determining the lines of trade and commerce. At all periods European trade routes have been connected with the Baltic and the North Sea, and from the form of the continent it obviously results that the farther east the route lies the greater is the saving of distance. The precise erection of the routes has been very largely fixed, and the line of the rivers has been largely fixed, and the line of the rivers has been largely fixed, and the line of the rivers, as far as the Oder and then down that stream. Another route is up the Danube to the neighbourhood of Vienna, and then northward through the Carpathians and the Sudetic range to the head-waters of the Oder, crossing a water-parting existence of 1000 ft. in altitude. The higher route was certainly the more direct, and was followed by the ancient Greeks, starting from Olympia near the mouth of the Bug, the objective point being the coast in the south-east of the Baltic. This route was an article of commerce in early times. This route was again much used in the middle ages, when Wisby, on Gotland, undoubtedly selected on account of the security afforded by an island station, was for hundreds of years an important centre of trade both in northern products (of which furs were the most valuable) and the East (pepper and other spices and other costly articles). Numerous coins, Roman, Byzantine and Arabic, found not merely in Gotland itself but also at various points along the route, are evidence of the importance of this route. In the middle ages the Oder route was also largely used whether reached by rounding the Carpathians or ascending the Danube, and in connexion with that route the island of Bornholm long formed a focus of commerce answering to that of Gotland farther east. The Danube route was also made use of farther west, and formed a large part of a great route connecting the East with the north-west of Europe, and the mouth of the Rhine, and access was had by fixed engines and vessels which were given for 1903, and accordingly excludes gas and other engines not driven by steam or water-power.

1 Including the installations returned in the Swiss industrial censuses as electric, most if not all of which are probably driven by water-power.

The figures derived from the three recent industrial censuses of Sweden, which are instructive, especially along the route, one is also including the electric among the hydraulic installations. The estimates that have been made of the total available water-power in a few European countries are mostly based on such methodical data that they are not worth giving. One very uncertain element in such calculations is the amount of water-power that is capable of being devoted to the production of power for various purposes, such as have been erected on a small scale in the Harz and the other mountain and smelting regions of Germany from an early date, and are now being built on a much larger scale in the Rhine region and other parts of the country. In all periods of the country.

The commercial history of Europe has illustrated from the earliest times the influence of the climate and geographical features in determining the lines of trade and commerce. At all periods European trade routes have been connected with the Baltic and the North Sea, and from the form of the continent it obviously results that the farther east the route lies the greater is the saving of distance. The precise erection of the routes has been very largely fixed, and the line of the rivers has been largely fixed, and the line of the rivers, as far as the Oder and then down that stream. Another route is up the Danube to the neighbourhood of Vienna, and then northward through the Carpathians and the Sudetic range to the head-waters of the Oder, crossing a water-parting existence of 1000 ft. in altitude. The higher route was certainly the more direct, and was followed by the ancient Greeks, starting from Olympia near the mouth of the Bug, the objective point being the coast in the south-east of the Baltic. This route was an article of commerce in early times. This route was again much used in the middle ages, when Wisby, on Gotland, undoubtedly selected on account of the security afforded by an island station, was for hundreds of years an important centre of trade both in northern products (of which furs were the most valuable) and the East (pepper and other spices and other costly articles). Numerous coins, Roman, Byzantine and Arabic, found not merely in Gotland itself but also at various points along the route, are evidence of the importance of this route. In the middle ages the Oder route was also largely used whether reached by rounding the Carpathians or ascending the Danube, and in connexion with that route the island of Bornholm long formed a focus of commerce answering to that of Gotland farther east. The Danube route was also made use of farther west, and formed a large part of a great route connecting the East with the north-west of Europe, and the mouth of the Rhine, and access was had by fixed engines and vessels which were given for 1903, and accordingly excludes gas and other engines not driven by steam or water-power.

1 Probably the most complete synopsis of the evidence on this point is to be found in Prince Kropotkin's "Fields, Factories and Workshops" (London, 1899).
times not only in the Baltic but also on the eastern shores of the North Sea north of the Rhine mouths, made regular use of at least three such passes. One of these was the Brenner, the summit of which is 10,560 ft. in height, that is, on the south-western slope of the valley of the Adige and its tributary the Eisak, on the other side by the Inn valley and that of its small tributary the Sill. By this route the Alps at about their widest are crossed with exceptional ease; and it is the most natural that it should have been the Etruscans to reach the amber shores of the Baltic, and in all subsequent periods in intercourse between central Europe and northern Italy until the work was performed by the Rhine the Alps appear to have used only the passes approached by the Dora Baltea, which leads equally to the Little St Bernard, to the south of Mont Blanc. The road of the Alps across the St Bernard does not appear to have been actively agitated for improving the Danube-Main connection either wholly or partly along the route of the present canal, and the more western passes, as the Sempach at 1,256 ft. in depth by way of the Neckar, the Rems and the Brenz, joining the Danube at Lautingen about midway between Ulm and Donaueschingen. The Moldau-Elbe is itself an important international waterway, as much as it allows of steamer traffic from Prague in Bohemia to Hamburg and by means of a connecting canal to Lübeck. But the most important of all international waterways in Europe is the Rhine, on which even sea-going steamers regularly ascend to Cologne, and an amount of traffic crosses the Dutch frontier three or four times as great as that which makes use of the Manchester ship-canal. The river is also navigable to Basel in Switzerland and by the Rhine and Rhone canal, which connects the two rivers through the Rhine and the Saône. The Rhine is also connected with the North Sea by the canal from Rheinfelden to Wiesbaden, and its tributary the Moselle is also navigable from France into Germany. The Meuse again is navigable from France through Belgium to join the Rhine at Liége. The main route from the Rhineland to Brussels was by way of the Saône, and the main route from Liége to the Rhine by way of the Meuse from Toulouse with Céte de la Meuse, which may be mentioned inasmuch as they establish communication between different seas. The last is of special interest because it is the oldest (completed in 1651), because it makes use of the lowest crossing, surrounding the passage of Naurouze, or Cap de Carcasonne, at an altitude of 625 ft., and because it effects the greatest shortening of distance from sea to sea. The line of the Meuse is also traversed by a number of modern roads along this route which has been as often revived as that of the Black Sea and Baltic canal. In the east of Europe the Vistula and Memel are both international waterways, but they are of little importance compared with those in the west. The Kaiser Wilhelm or North Sea and Baltic canal, opened in 1895, has, however, no little international value, inasmuch as it shortens the sea-route to the Volga by 747 miles, which is the means of avoiding a rather dangerous passage round the north of Jutland. A minor degree of international interest belongs to the ship-canal through the Isthmus of Corinth, opened on the 6th of August 1893.

The following table gives a summary statement of the progress of navigation in each of the countries down to the end of the 19th century:

1 Excluding Finland.
The chief railways of most European countries are on the same gauge as the one originally adopted in Great Britain, namely 3 ft. 6 in. Irish railways are, however, on the gauge of 5 ft. 3 in. The standard gauge in Russia is 5 ft., that of Spain and Portugal about 5 ft. 5 in., and in Switzerland, in 1863, the railway system of Greece is uniformly on the French gauge. The very general use of a common gauge obviously greatly facilitates international trade. It allows, for example, of wagons from Germany entering every country on its frontier except Russia. It also avoids the necessity of having more than one gauge from Paris to Milan and the mainland of Denmark. By means of trains ferries German trains can also be conveyed to Copenhagen by way of Hamburg, Lübeck, and Gudern, and thereby avoids the change of gauge from the German Sächsisch-Filster and Zealand; and there is a similar means of communication between Copenhagen and Malmo (Sweden) and between Lundin in Barne and Malmo in Sweden, by means of the long narrow boat on the canal, in the Swiss canton of Thurgau. The establishment of this method of transport between England and France has been urged in opposition to the Channel Tunnel scheme.

Of the systems of the mainland of Europe as a whole the main features are these. There is a broad belt running from the North Sea eastwards between the lines marked by Amsterdam and Hamburg forming an artery of importance. There is a similar belt from north to south, in which important lines of railway run from west to east. About 12° E. those lines begin to converge on Berlin. This is the cross in the Rhine valley by a much narrower but very important belt of railways along which and also of towns fan out as the Italian railway system through the St Gotthard tunnel. To the south of the west end of the west-to-east belt lies the principal railway focus of the three great cities of Paris, from which it is important in all directions; two of these radiating lines now establish communication with the Italian railway system, through the Mont Cenis and the Simplon tunnel respectively, and the other two connect the Spanish system round the ends of the Pyrenees. Berlin in central Europe is perhaps an even more important railway focus. Among the chief lines radiating from it are one through Leipzig and Munich and one through Hannover and the Italian railway system; by the Bremen route and another through Dresden and Prague to Vienna, and then by the Semmering pass by one route to Triest and by another to Venice. East of Berlin a third line diverges towards the east-north-east, one by Kustrin and Königsberg and the other by Frankfort on the Oder and Thorn, both unifying at Szczecin and the east of Königsberg. Berlin crossing the Prussian frontier and passing on to St Petersburg. From Thorns a line branches off to Warsaw to Moscow, the chief railway focus in eastern Europe. South-east from Berlin there runs another important line diverging to Dresden. The route to Breslau, Grimmen, and Magdeburg is skirting to a large extent the foot-hills of the Carpathians like the ancient trade route from Olbia to the Baltic. Two routes on which there are services organized by the International Sleeping Car Company connect London with Constantinople, and it is noteworthy that both of these indicate the importance of the physical feature which has determined the position of the great north-south belt of railway communication and which has been so fruitful for the building of railways. Speranszky and general economic backwardness have also proved hindrances, especially in Russia and the Balkan Peninsula.. The railways to Constantinople and Salonica international importance on the opening of the St Gotthard tunnel, inasmuch as it lies on the route thence through Lucerne to the Rhine valley at Basel, and that which crosses the Col de Jougne between Valloire and Brianza, are notable for the building of the Simplon tunnel. Further projects are entertained for shortening the connexion between this tunnel and the north of France by a line from Verviers to the Belgian end of the Jura, or by making a railway across or under the Col de la Faucille (4340 ft.), north-west of Geneva.

There are two railways round the extremity of the Pyrenees, the western was the first to be constructed, the eastern was not opened until 1878. Hitherto the interfering mountains have proved more of a railway barrier than the mighty system of the Alps, and the chief connecting routes by railway are those of the Spanish governments providing for the establishment of railway connexion between the two countries at three points of the great divide.

There are several railways across the Carpathians, mostly by passes under 3000 ft. in height. The fact that the Tomos Pass, on the direct line from Hungary through Austria to Bucharest, attains an altitude of 3760 ft. was undoubtedly one reason for the building of the railway following this route, completed in December 1879, passing through several tunnels, was one of the last to be constructed. But the obstacle of mountains is still very great to the east and Lemberg, crossing the Alleghany range and commencing in Russia connecting Novoyorkerkass and Velikavakass, and branches running from the same point connecting that line with Novorossysk on the Black Sea on the one hand, and with Tsarskoye (at the site of the Volga on the other) hand, then up the Oka into the Volga, through Archangel into connexion with the European system at Vologda (opened in 1896); a detached line in the north-east across the Urals from Perm by Ekaterinburg (completed in 1879) to Tyumen (completed in 1884). Chelyabinsk on the Siberian railway has a branch running northwards to Ekaterinburg, and this line now affords uninterrupted communication with the northern Urals, inasmuch as the railway which originally started at Perm has been carried westwards by Vytatka and then northwards to Koria at the point of origin of that river, to which point it was opened in 1896; it is a little in Ljubov, and the Altai and Krasnoi from Samara with the great mining centre at Zlatoust, already in 1890 continued across the Urals to Miysas, and since then carried farther east to the great Siberian settlement of 85° E. long., 29° N. lat. in average sea-level or nearly 3000 ft. above the level of the pass. South of the Semmering, however, various other passes have to be crossed, and it was not till 1877 that the railway to Triest (by Lainsitz) was completed. On these last the line was opened only in 1906. After the Semmering the next railway to cross the Alps was that following the Brenner route which crosses the summit of the pass at the height of 4909 ft. and, as already stated, is the only railway to have to cross it on the way from Munich to the plains of Italy. Next followed in 1871 the western route through the so-called Mont Cenis tunnel, really under the Col de Fréjus, to the west of the Mont Cenis pass, and effecting a crossing between the valleys of the Arc (Rhone basin) and the Dora Riparia (Po basin) at an altitude of 4313 ft., or nearly 2900 ft. lower than the pass previously used, but only by piercing the mountains in a tunnel more than 77 m. long. Next in order was the St Gotthard route, measuring the St Gotthard railway. The St Gotthard railway, in the old line of St Gotthard, is 4900 ft. above sea-level and is over 200 ft. more on the old line of St Gotthard, is 4900 ft. above sea-level and is over 200 ft. more than the new line. The new line runs over the upper Rhone valley and the Toce valley, shortening the route between Milan and northern France, effects the crossing at an altitude of 1350 ft. and increasing the tunnel length to 121 m. Steps were subsequently taken to continue the Simplon route northwards by a tunnel through the Simplon pass and to construct the line of the Vintchegau (upper Adda) railway across or under the Reschenscheideck to the Inn valley. An important east-west crossing of the Alps was effected when the Arlberg tunnel (6.37 m. summit level) was opened in 1873. This tunnel has an altitude of 4340 ft., north-west of Geneva.
the East is once more carried on through the Mediterranean as it was in ancient times and the middle ages. The great shortening of the sea-route in this trade at such ports as Marseilles, Trieste, Venice and Genoa, indicated by the figures below, goes far to counterbalance the extra cost even of railway transport across the mountains.

An enormous amount of investigation with regard to European ethnology has been carried on in recent years. These labours have chiefly consisted in the study of the physical type of different countries or districts, but it is not necessary to consider in detail the results arrived at. It should, however, be pointed out that the idea of an Aryan race may be regarded as definitely abandoned. One cannot even speak with assurance of the diffusion of an Aryan civilization. It is at least not certain that the civilization that was spread by the migration of peoples speaking Aryan tongues originated amongst and remained for a time peculiar to such peoples. The utmost that can be said is that the Aryan languages must in their earliest forms have spread from some geographical centre. That centre, however, is no longer sought for in Asia, but in some part of Europe, so that we can no longer speak of any detachment of Aryan-speaking peoples entering Europe.

The most important works, summarizing the labours of a host of specialists on the races of Europe, are those of Ripley and Deniker. Founding upon a great multitude of data that have been collected with regard to the form of the head, face and nose, height, and colour of the hair and eyes, most of the leading anthropologists seem to have come to the conclusion that there are three great racial types variously and intricately intermingled in Europe. As described and named by Ripley, these are: (1) the Teutonic, characterized by long head and face and narrow aquiline nose, high stature, very light hair and blue eyes; (2) the Alpine, characterized by round head, broad face, variable rather broad heavy nose, medium height and "stout" frame, light chestnut hair and hazel grey eyes; and (3) the Mediterranean, characterized by long head and face, rather broad nose, medium stature and slender build, dark brown or black hair and dark eyes. The Teutonic race is entirely confined to northwestern Europe, and embraces some groups speaking Celtic languages. It is believed by Ripley to have been differentiated in this continent, and to have originally been one with the other long-headed race, sometimes known as the Iberian; and the Italians as the Ligurian race, which "prevels everywhere south of the Pyrenees, along the southern coast of France, and in southern Italy, including Sicily and Sardinia," and which extends beyond the confines of Europe into Africa. The Alpine race is geographically intermediate between these two, having its centre in the Alps, while in western Europe it is spread most widely over the more elevated regions, and in eastern Europe it becomes less pure in proportion as we go east from the Carpathian across the great plains of European Russia. This last race, which is most persistently characterized by the shape of the head, is regarded by Ripley as an intrusive Asiatic element which once advanced as a wedge amongst the earlier long-headed population as far as Brittany, where it still survives in relative purity, and even into Great Britain, though not Ireland, but afterwards retired and contracted its area before an advance of the long-headed races. Deniker, basing his classification on essentially the same data as Ripley and others, while agreeing with them almost entirely with regard to the distribution of the three main traits (cephalic index, colour of hair and eyes, and stature) on which anthropologists rely, yet proceeds further in the subdivision of the races of Europe. He recognizes six principal and four secondary races. The six principal races are the Nordic (answering approximately to the Teutonic of Ripley), the Littoral or Atlantic-Mediterranean, the Ibero-Islamic, the Oriental, the Adriatic or Dinaric and the Occidental or Cenozoic.

1 See bibliography at the end of the article.

**Language.**

Although language is no test of race, it is the best evidence for present or past community of social or political life; and nothing is better fitted to give a true impression of the position and relative importance of the peoples of Europe than a survey of their linguistic differences and affinities. The following table contains the names of the various languages which are still spoken on the continent, as well as of those which, though now extinct, may be clearly traced in other forms. Two asterisks are employed to mark those which are eminently dead languages, while one indicates those which have a kind of artificial life in ecclesiastical or literary usage.

From this conceptus it appears that there are still about 60 distinct languages spoken in Europe, without including Latin, Greek, Old Slavonic and Hebrew, which are still used in literature.

1 See on the whole subject Hovelacque's Science of Language, Latham's Nationalities of Europe, and the same author's Ethnicity.
or ecclesiastical liturgies. Besides all those which are spoken over extensive territories, and some even which are confined within very narrow limits, are broken up into several distinct dialects.

The boundaries of European countries have of course been determined by history, and in some cases only historical events can be held to account for their general situation, the influence of geographical conditions being seen only on a minute examination of details. In most cases, however, it is otherwise. The present political boundaries were all settled when the general distribution of population in the continent was in a large measure determined by the geographical conditions, and accordingly the lines along which they run for the most part show the influence of such conditions very clearly, and thus present in many cases a marked contrast to the political boundaries in America and Australia, where the boundaries have often been marked out in advance of the population. In Europe the general rule is that the boundaries tend to agree with some considerable strip or tract of country such as is formed by mountain ranges, elevated tablelands too bleak for cultivation, relatively high ground of no great altitude where soil and climate are less favourable to cultivation than the lower land on either side, or low ground occupied by heaths or marshes or some other sterile soil; but it is the exception for important navigable rivers to form boundaries between countries or even between important administrative divisions of countries, and when such conditions are found a special geographical nation can be said to be found. Navigable rivers unite rather than separate, for the obvious reason that they generally flow through populous valleys, and the vessels that pass up and down can touch as easily on one side as the other. Minor rivers, on the other hand, flowing through sparsely peopled valleys frequently form portions of political boundaries simply because they are convenient lines of demarcation. A brief examination of the present political map of Europe will serve to illustrate these rules.

The eastern frontier of the Netherlands begins by running southwards through a marsh nearly parallel to the Ems but nowhere touching it, then winds south or south-westwards through a rather sparsely peopled district to the Rhine. This river it crosses. It then approaches but does not touch the Dutch frontier, but runs some considerable distance to the north, roughly parallel to that river along higher ground, where the population is much more scanty than in the valley. On the side of Belgium the Dutch boundary forms for the most part the ordinary typical winding between the dreariest parts of the Dutch or Belgian provinces of North Brabant, Limburg and East Friesland. Scheidt now forms a boundary between countries, not even at its wide estuary. The eastern frontier of Belgium is quite typical of the side of a mountainous region, like Luxembourg. It is otherwise, however, on the south, where that country confines with France, and indeed the whole of the north-east frontier of France may be called a historical frontier, showing the influence of geographical conditions only in details. One of these details, however, deserves attention. The tongue in which it advances northwards into Belgium so as to give to France the natural fortress of Givet, a tongue, be it noted, the outline of which is a typical a boundary as is to be seen in Europe in respect of scantiness of population, apart from the fortress.

The mountainous frontiers of France on the east and south require hardly any comment. Only in the Burgundy Gate between the Vosges and the Jura has an artificial boundary had to be drawn, and this is one of the degenerate exceptions to the general rule. The division of the Iberian peninsula between Spain and Portugal goes back in effect to the Christian reaction against the Moors. The valley of the Mino and its tributaries establishes a natural connection between Galicia and the rest of Spain; but an independent crusade against the Moors starting from the lower part of the valley of the Douro resulted in the formation of the kingdom of Portugal, which found its natural eastern limit on the sparsely peopled margin of the Iberian tableland, where the rivers cease to be navigable and flow through narrow gorges, that of the Tagus, where the river marks the frontier, being almost without inhabitants, especially on the Spanish side.

The greater part of the Italian boundary is very clearly marked geographically, though we have to look back to the weakness of divided Italy to account for the instances in which its northern mountainers have pushed their way into southern Alpine valleys. Even in these parts, however, there are interesting illustrations of geographical influence in the way in which the Italian Alps crosses the northern ends of the Lago Maggiore and the Lake of Garda, and cuts off portions of Lake Lugano both in the east and west. In all these cases the frontier crosses from one steep uppeoped slope to another, assigning the population at different ends or on different sides of the lake to the country to which belongs the adjacent population not lying on their shores.

Of the Swiss frontiers all that it is necessary to remark is that the river Rhine in more than one place marks the boundary, in one, however, where it traverses alluvial flats liable to inundation (on the side of Austria), in the other place where it rushes through a gorge below the falls of Schaffhausen. The southern frontier of Germany is almost throughout typical, the northern is the sea, except where a really artificial boundary runs through Jutland.

In the east of Germany and the north-east of Austria the winding frontier through low plains is the result of the partition of Poland, but in spite of the absence of marked physical features it is for the most part in its details almost as typical as the mountainous frontier on the south of Germany. All the great rivers are crossed. Most of the line runs through a tract of strikingly scanty population, and the dense population in one part of it, where upper Silesia confines with Russian Poland, has been developed since the boundary was fixed. In the Balkan Peninsula the most striking facts are that the Balkans do not, and the Danube to a large extent does form a boundary. Geographical features, however, bring the valley of the Morava in an exact relation with the present south-eastern frontier. The connexion with which Bulgaria north of the Balkans had long been established by the valley of the Isker, narrow as that valley is. On the side of Rumania, again, it is certain that the borders of the Danube even more than the river itself make that of that river a frontier. An examination of the eastern boundary of all that is included in Russia in Europe will furnish further illustrations of the general rule.

Finally, on the north-west of Russia it was only natural that the Torne and the Tana should be taken as lines of demarcation in that thinly peopled region, and it was equally natural that where the

## Population of Europe

The following table shows the area of the countries of Europe, with their estimated or enumerated populations in thousands (oo omitted) at different dates. A noteworthy feature of the distribution of population in Europe, especially in western, southern, and central Europe, in modern times, is the high degree of aggregation in towns, which is exhibited in the following table 1 for the different countries or regions of the continent:

### Population

</table>

though enormously influenced by outside forces, possesses from the first a character of its own, which enables it to be treated as a separate unit. This historical Europe, however, has never been exactly manageable with Europe considered as a geographical division. Russia, though part of Europe geographically—even if we set the limits of Asia at the Don with certain old geographers—had but slight influence on European history until the time of Peter the Great. The Ottoman empire, though its influence on the affairs of Europe was from the first profound, was essentially an Asiatic power, and was not formally introduced into the European system until the treaty of Paris of 1856. It still remains outside European civilization.

Europe, then, as we now conceive the term in its application to the political system and the type of culture established in this part of the world, may, broadly speaking, be traced to four principal origins: (1) The Aegean civilization (Hellenic and pre-Hellenic); (2) the Roman empire; (3) Christianity; (4) the break-up of the Roman empire by the Teutonic invasions. All these forces helped in the development of Europe as we now know it. To the Aegean civilization, whether transformed by contact with Rome, and again transformed by the influence of Christianity and the religious genius of the middle ages—or re-discovered during the classical Renaissance—Europe owes the characteristic qualities of its thought and of its expression in literature and art. From republican Rome it largely draws its conceptions of law and of administrative order. From the Roman empire it inherited a tradition of political unity which it has been able to maintain in its present form. A new unity has been added to the Teutonic invasions, which developed into modern international law. Yet more does Europe owe to Christianity, an Asiatic religion, but modified by contact with Greek thought and powerfully organized on the lines of the Roman administrative system. The Roman Church remained a reality when the Roman empire had become little more than a name, and was throughout the period of chaos and transformation that followed the collapse of the Roman empire the most powerful instrument for giving to the heterogeneous races of Europe a common culture and a certain sense of common interests.

The history of Europe, then, might well begin with the origins of Greece and Rome, and trace the rise of the Roman empire and the successive influence upon it of Hellenism and Christianity. These subjects are, however, very fully dealt with elsewhere (see AEGEAN CIVILIZATION; GREECE; ROME; CHURCH HISTORY); and it will, therefore, be more convenient to begin this account with the Teutonic invasions and the break-up of the Roman empire, events which mark the definite beginning of the modern European states system.

In a sense the Roman empire had been already "barbarized" before the invasions of the barbarians en masse. Land left vacant by the dwindling of the population was colonized by immigrants. Teutonic and other, from beyond the frontiers; the Roman legions were largely recruited from Germans and other non-Romans, some of whom even rose to the imperial purple. Thus, in the end, the Roman emperor, with his guard and his household, ruling over an empire mercilessly exploited to fill his treasury, was essentially indistinguishable from those barbarian chieftains, with their outrages and their primitive fiscal methods, who entered into portions of his inheritance and carried on the traditions of his rule. The history of the Teutonic peoples prior to their organized invasions of the empire is dealt with elsewhere (see TEUTONIC PEOPLES). It was in the 4th century that the pressure of their advance was first felt on the frontiers, and this led to a change in the government of the empire which was to have notable consequences. In A.D. 330 Constantine had transferred the capital from Rome to Byzantium (Constantinople), but the empire, from the Firth to the Tigris, continued to be administered successfully from a single centre. Not, however, for long: the increasing perils from without made a closer supervision essential, and after the death of Theodosius I. (395) the empire was divided
between emperors of the East and West. It was the beginning not only of the break-up of the empire, but of that increasing divergence between the eastern and western types of European religion and culture which has continued to this day.

The pressure of the Teutonic invasions became increasingly strong during the reigns of the emperor Valens and his successors. These invasions were of two types, (i) migrations of whole peoples with their old German patriarchal organization complete, (ii) bands, larger or smaller, of emigrants in search of land to settle on, without tribal cohesion, but organized under the leadership of military chiefs. The earlier invaders, Goths and Vandals, and later the Burgundians and Lombards were of the first type; to the second belonged the Franks, "free" men from the Saxon plain, and the Saxon invaders of Britain. The distinction was a vital one; for the Goths, Vandals, Burgundians and Lombards never took root in the soil, and succumbed in turn, while the Frankish and Saxon immigrants, each man lord in his own estate, not only maintained themselves, but set up at the cost of the Roman organization and of the power of their own kings a wholly new polity, based on the independence of the territorial unit, which later on was to develop into feudalism.

It was owing to the pressure of Germanic invaders from the East that the Teutonic peoples were first forced to take refuge within the empire. In 376 the Goths defeated and slew the emperor Valens in a battle near Adrianople, in 410 Alaric, king of the West Goths, sacked Rome; and shortly after his death the Goths passed into Gaul and Spain. In 429 Gaiseric, king of the Vandals, at the invitation, it is said, of the governor Bonifacius, passed over from Spain to Roman Africa, which became the centre of another Teutonic kingdom, soon established as a great naval power which for a while commanded the Mediterranean and devastated the coasts of Italy and Sicily with its pirates.

Meanwhile the Franks and Burgundians were pressing into Germany and Gaul, while from 449 onwards the Saxons, the Angles and the Jutes invaded and occupied Britain. For a moment it was doubtful if the Aryan or Persian races would be supreme, but, in 451 Attila, king of the Huns, was decisively beaten in the battle of Chalons by a combination of Franks, Goths and Romans under the Roman general Aetius and Theodosius, king of the Goths. This battle decided that Europe was to be Christian and independent of Asia and Africa. In 476 the succession of Western emperors came to an end with Odoacer's occupation of Rome, and with the decision of the Roman senate that one emperor was enough, and that the Eastern emperor, Zeno, should rule the whole empire. For a time Theodoric, king of the East Goths, ruled Italy, Gaul and Spain; but after his death in 526 the empire of the East Goths was shattered, and changes took place which led to the rise of independent Teutonic kingdoms in Gaul and Spain. In 511 Clovis (d. 511), the king of the Franks, had already established his power, and in Spain, the West Gothic kingdom, with its capital at Toledo, now asserted its Teutonic independence. Under the emperor Justinian (527-565), indeed, the Roman empire seemed in a fair way to recover its supremacy; the Vandal kingdom in Africa was destroyed; in 554 the Byzantine general Narses finally shattered the power of the East Goths in Italy, and the exarchate of Ravenna was established in dependence on the Eastern emperor; the West Goths were forced to give up the south of Spain; and the Persians were checked. But with the death of Justinian troubles began. In 568 the Lombards, under Alboin, appeared in Italy, which they overran as far south as the Tiber, establishing their kingdom on the ruins of the exarchate. Though in Asia the emperor Heraclius, in a series of victorious campaigns, broke the Persian power and succeeded even in extending the Roman dominion, Italy, save for a while Ravenna itself and a few scattered sea-coast towns, was thenceforth lost to the empire of which in theory it still formed a part.

This catastrophe produced one result the importance of which is impossible to exaggerate: the development of the political power of the papacy. At the beginning of the 6th century Rome, under Theodoric the Goth, was still the city of the Caesars, the tradition of its ancient life was yet unbroken; at the end of the century Rome, under Pope Gregory the Great (590-604), had become the city of the popes, and with the city the popes entered into some of the inheritance of the Caesars; in the world-wide activity of Gregory we already have a foreshadowing of universal claims, often effectively asserted, which made the great medieval popes, in a truer sense than the medieval emperors, the representatives of the idea of Roman imperial unity (see Rome, sec. ii, Middle Ages: Papacy).
The next event that profoundly affected the history of Europe was the rise of Mahommedanism. In A.D. 622, sixteen years after Gregory's death, occurred the flight (Hijra) of Mahomet from Mecca to Medina, which fixed the memorable era of the Hegira. The full force of the militant religion founded by the Arab prophet was not felt till after his death (632). The emperor Heraclius, the vigour of his manhood passed, was unable to meet this new peril; the Arabs, strong in their hardy simplicity and new-born religious fanaticism, and aided by the treachery and cowardice of the decadent Roman governing classes, overran Asia Minor, conquered Egypt and the whole of northern Africa, overwhelmed the Gothic kingdom in Spain, and even penetrated beyond the Pyrenees to the conquest of the province of Narbonne. One of the chief effects of these Arab conquests was that Christian civilization became gradually confined to Europe; another was that the trade routes to the East were closed to the Western nations. The conquest of Narbonne marked the limit of the advance of Islam in western Europe, for in 732 the Arabs were overthrown by Charles Martel in the battle of Tours, and a few years later were driven out of Gaul. In Spain, however, they succeeded in maintaining themselves throughout the middle ages, developing a high type of civilization which had a considerable influence on the intellectual life of medieval Europe; and it was not till 1494 that Granada, their last possession in the peninsula, was conquered by the Christian monarchs, Ferdinand and Isabella.

The battle of Tours emphasized and increased the power and reputation of Charles Martel. As a mayor of the palace to the decadent Merovingian successors of Clovis, he was virtually ruler of the Franks, and, after his death, the last of the rois foîndants of the house of Merovech was deposed, and Pippin, Charles's son, was elected king of the Franks. The prestige of the Carolingian house (to give it the name it was later known by) was increased when, at the urgent entreaty of Pope Stephen III., Pippin marched into Italy and saved Rome from the Lombards, who were endeavouring to extend their power southwards. Pippin's son Charles (Charlemagne) finally conquered the Lombards in 774 and thus added part of northern Italy to his dominions.

In 797 an event of the highest importance to the European world took place. The emperor Constantine VI. was deposed by his mother Irene, who seized the throne. Thereupon Pope Leo and the Roman people definitely threw off all the authority of the emperors of Constantinople, on the ground that a woman could not hold the position of Caesar. In 800 Leo crowned Charlemagne emperor at Rome, and henceforth till 1453, when Constantinople was conquered by the Turks, there was an Eastern and a Western empire. Till his death in 814 Charlemagne was king of the Franks as well as emperor. His kingdom embraced not only all Germany and modern France, but included a large part of Italy and Spain as far as the Ebro. Under his rule western Europe was united in a powerful empire, in the organization of which the principles of Roman and Teutonic administration were blended; and, after his death, he left to his successors, the Frankish and German kings, the tradition of a centralized government which survived the chaos of the period that followed, and the prescriptive right to the title and prestige of Roman emperors—a tradition and a claim that were to exercise a notable effect on the development of European history for centuries to come. (See FRANCE: HISTORY and CHARLEMAGNE.)

The period from the death of Charlemagne (814) to the 12th century is characterized in western Europe by the general weakening of the idea of central government and by the rise of feudalism. During the same period the East Roman or Byzantine empire escaped disruption and, preserving the traditions of Roman civil and military administration, formed an effective barrier for Europe and Christendom against the advancing tide of Islam. At the same time, however, the growing divergence between the Eastern and Western Churches, which had been accentuated by the iconoclastic controversy (see ICONOCLASTS), and was destined in 1053 to culminate in a definite schism, was gradually widening the breach between the two types of European civilization, which came into violent conflict at the beginning of the 12th century, when crusaders from western Europe captured Constantinople and set up a Latin empire in the East (see ROMAN EMPIRE, LATER; CHURCH HISTORY; CRUSADES). In western Europe, meanwhile, the unity of the empire did not long survive Charlemagne. Its definite break-up dates from the treaty of Verdun (843), by which Charles the Bald received Neustria, Aquitaine and western Burgundy, Louis the German Bavaria, Swabia, Saxony and Thuringia, and the emperor Lothair the middle kingdom known by his name, the regnum Lotharii or Lotharingia (see LORRAINE). By the partition of Mersen (870) Lotharingia itself was divided between the West and East Frankish realms—France and Germany, terms which from this time begin to represent true national divisions. With the treaties of Verdun and Mersen the history of the European state system may be said to begin.

At first, indeed, it seemed as though the nascent states were about to be dissolved by disruption from within and attacks from without. All alike were subject to the attacks of the Norse sea-rovers, hardy pirates who not only scourged all the coasts of Europe but penetrated, burning and harrying, far inland up the great waterways. Meanwhile, the weakening of central government due to dynamic
struggles had led to the growth of independent or semi-independent powers within the states themselves. The Frank landowners had successfully asserted their independence of the jurisdiction of the king (or emperor) and his officials; the imperial officials themselves, dukes or counts, had received grants of lands with similar immunities (desecfesto), and these had become hereditary. The great feudal magnates of France, Burgundy, Spain, Italy, and soon the growing anarchy, men looked for protection rather than to the weak and remote central power; and so, out of the chaos that followed the break-up of the empire of Charlemagne, was born the feudal system of the middle ages (see Feudalism). This organization was admirable for defence; and with its aid, before the close of the first decade of the 10th century, the frontiers of France and Germany had been made safe against the northern barbarians, who had either been driven off and barriers erected against their return—e.g. the marks established by Henry the Fowler along the middle Elbe—or, as in the case of the Normans, absorbed into a system well adapted for such a process. By the treaty of St Claire-sur-Épte (911) between Charles the Simple and Rollo, chief of the Norsemen, the Normans were established in the country since known as Normandy (q.v.), as feudatories of the French crown. In England, by the treaty of Wedmore (878) between Alfred and the Danish king Guthrum, the Danes had already been established in a large part of England.

Feudalism, by the time the Northmen had been subdued by its aid, was quite firmly established in the western part of Europe. During the 11th century it was carried by the Normans into England, into Sicily and southern Italy, and by the nobles of the first crusade into the newly established kingdom of Jerusalem (1099). By the kings of France, England and Germany, however, who saw themselves in danger of being stripped of all but the semblance of power by its delega-
tion to their more or less nominal vassals, the feudal organization was early recognized as impossible as a form of state government, if the state was to be preserved; and the history of the three great European powers during the succeeding centuries is mainly that of the struggle of the sovereigns against the disruptive am-
bitions of the great feudal nobles. In England the problem was, from the outset, simplified; for though William the Conqueror introduced the system of feudal land tenure into England in 1066 he refused to set it up as his system of government, retaining alongside of it the old English national policy. In France, on the other hand, feudalism as a system of government had become firmly established; and it was not till the days of Philip Augustus (1180–1223) and Louis IX. (1226–1270) that the monarchy began to get the upper hand. From this time until the 17th century the power of the French monarchy, in spite of occasional lapses, grew steadily stronger. The reverse was the case with the German king in its association with the undefined claims involved in the title of Roman emperor, traditionally attached to it, and notably those to authority in Italy, necessitated conces-
sion after concession to the feudal nobles, in order to purchase their support for their assertion. The kingship, moreover, became elective; the imperial title was obtainable only at Rome at the hands of the pope; and the German kings thus became entangled in contests, not only with their own vassals, but with the tremendous spiritual force of the medieval papacy, to which, for its own ends, the spirit of feudal insubordination was from time to time fomented. Thus in Germany the feudal nobles gradually acquired a sovereign status which, in some cases, has survived the territorial rearrangements of the 19th century and left its mark on the federal constitution of modern Germany; while the kingship and the imperial title grew more and more shadowy till 1806 it vanished altogether. (See ENGLISH History: Feudalism. The rise of the House of Capet.)

In France the process by which a strong hereditary monarchy was established was a slow one. During the greater part of the 10th century the Carolingians, stripped of the vast domains which had been the basis of the power of Pippin, owed their continued existence to the for-
bearance of Hugh the Great, count of Paris. In 987, however, the last Carolingian king died, and Hugh Capet, son of Hugh the Great, the most powerful of the territorial magnates, was chosen king of France. With his election dates the real beginning of the French monarchy, and under him and his suc-
cessors Paris became the capital of France. Hugh's election, however, was the work of the great feudatories, and France remained divided among a number of great fiefs, of which the chief were Brittany, Anjou, Flanders, Vermandois, Champagne, Burgundy, Aquitaine, Poitou, Gascony, Toulouse and Normandy.

While the central power in France advanced slowly but steadily, the development of the royal authority in Germany was in the 10th and 11th centuries more rapid. In 911 the German magnates had elected Conrad the Franconian to reign over them, and in 919 Henry I., the Fowler, of Saxony, "whose reign forms one of the great turning-points in the history of the German nation." He defeated the Hungarians, the Slavs and the Danes, and by encouraging the growth and development of towns he contributed greatly to the formation of the German kingdom. His immediate successors, Otto the Great and Otto II., continued his work, which was only interrupted for a short time during the reign of the idealist Otto III., whose "cosmopolitan imperialism" brought him into collision with the German Church and to some extent with the German nobles. Henry II. (1002–1024) asserted his authority over Germany, and his successor, Conrad II., who belonged to the Salian or Franconian line, did much to secure unity and prosperity to the Empire. His son and successor Henry III. (1050–1056) governed Germany wisely, and his reign witnessed the culminating point of the Holy Roman Empire. At the time of his death it seemed probable that Germany, like England and France, would gradually escape from the thraldom of the great feudatories. The future of the German monarchy depended upon the ability of future kings to suppress the forces of feudal disintegration in Germany, and to withstand the temptation of struggling to establish their influence over Italy. Unfortunately for German kingship Henry IV. (1056–1106) was only six years old on his accession, and when he became a man he found that the papacy under Hildebrand's influence was practically independent of the emperor. Had Henry confined his efforts to coercing the German barons he might, like the Normans and Angevins in England, and like the Capetians in France, have proved successful. Unfortunately for Germany Henry entered upon the famous contest with the papacy under Gregory VII. (1073–1080), which ended in the 13th century in the defeat of the Empire in the person of Frederick II. The struggle began in 1073 over the question of investiture (q.v.), and widened into a duel between the spiritual and temporal powers. During the early years of the contest the influence of the papacy reached a high pitch and made itself felt in the crusad-
ing movement, which in turn fomented partitions of the states from Pope Urban II., who appealed to Europe at the council of Clermont in 1095 to recover the Holy Places from the Turks.

During the 12th century the Eastern Empire was attacked by the Russians, the Normans and the Seljuks. The emperor Alexius Comnenus found himself on his accession in 1081 threatened by the Seljuks (the victors in the de-
cisive battle of Manzikert in 1071) and by the Sicilian Normans who in 1081 besieged Durazzio. In 1083 he defeated the Normans in the battle of Durazzio, and with the death of Robert Guiscard in 1085 all danger from a fresh Norman invasion passed away. But the first crusade brought new anxieties to Alexius, for he feared that the crusaders might attack Constantinople. That fear removed, he took advantage of the increased connexion between eastern and western Europe by bestowing commercial privileges upon the Italian trading cities, who thus gained access to the ports of the Empire on easy terms.

With the era of the Crusades, which lasted till the middle of the 13th century, Europe entered upon a period of change, the importance of which is realized by contrasting the condition of western Christendom in the 11th with its condition in the 13th century. Between the opening and close of the crusading movement Europe underwent a complete revolution. While the
Caesars, and planted the crescent on the dome of the metropolitan church of Eastern Christendom (see TURKEY; and ROMAN EMPIRE,东罗马帝国). The fall of Constantinople marked the definite establishment on European soil of a power alien and hostile to all that was characteristic of European civilization. It was a power, moreover, which could live only by expanding; and for over two hundred years to come the dread of Ottoman aggression was a dominant factor in the politics of eastern Europe. The tide of Turkish advance could have been arrested by a union of Europe; but the appeals of Pope Nicholas V. fell unheeded upon the sceptical age, intent only on its dynastic and particularistic ambitions. To the emperor the ousting of the Ottomans from the Balkan peninsula seemed of less importance than the consolidation of the Habsburg power in Germany, and its extension over the neighbouring kingdoms of Hungary and Bohemia. France was exhausted by the long agony of the Hundred Years' War, which came to an end the very year of the fall of Constantinople, and the French kings—especially Louis XI. (1461-1483)—were busy for the rest of the century crushing out the remnants of feudalism and consolidating the power of the monarchy. As for Italy, with its petty tyrants and its condottieri, there was no hope of uniting it for any purpose whatever, least of all a religious purpose, and Spain was busy with her own crusades against the Moors. The exploits of John Hunyadi, king of Hungary, against the Turks, therefore, remained isolated and unsupported. In 1456 he checked their advance northwards by a brilliant victory which left the belief of Belgrade. He died the same year, and his death was followed by a struggle for the succession between Hungarians and Bohemians. The racial and religious quarrels of the Balkan peoples had made it possible for the Turks to obtain a foothold in Europe; the jealousies and internecine struggles of the Christian states made possible the vast expansion of the Ottoman power, which in the 17th century was to advance the frontiers of Islam to those of Germany and to reduce the emperors, in their relations with the Porte, to the status of tributary princes. The victory of Ladiislaus, son of Casimir, king of Poland, who succeeded in uniting in his own person the crowns of Bohemia, Hungary and Poland, threatened to result in the permanent independence of those countries of the house of Habsburg. But in 1456 Ladislaus was compelled by Maximilian, son of Frederick III., to sign the treaty of Presburg, providing for the eventual succession of the Habsburg to Hungary and Bohemia. In other ways the reign of Frederick III. laid the foundations of the greatness of his family. In 1477 Maximilian married Mary, Duchess of Burgundy and heiress of Charles the Bold, and through her the Habsburgs obtained Franche Comté and the Netherlands. The line, Bella gerant aliis, tu felix Austria nube, well described the method by which the house of Habsburg increased its possessions and established its fortunes. A.E.I.O.U. (Austria est imperare orbi universo) was the device invented for his house at that time by Frederick III. and it proved no idle boast. Maximilian I., the son of Frederick III., reigned from 1493 to 1519, and during his reign Europe passed from medieval to modern times. Some reforms in the Empire were carried out, but the events of his reign made it apparent that it was impossible to set up a centralized monarchy in Germany (see MAXIMILIAN I.; GERMANY and AUSTRIA: HISTORY).

For different developments were taking place during the 14th and 15th centuries in France, Spain, the Scandinavian north and in England. During the greater part of the 14th century France was engaged in foreign wars and in internal complications, and it seemed doubtful if a strong centralized monarchy would be firmly established. The failure of Philip VI. (1328-1350) and John (1350-1364), in their contest with England weakened the central power in France, and, though Charles V. (1364-1380), owing to his own sagacity and the weakness of the English government, managed to regain for France many of her lost provinces, the French power both at home and abroad again declined under the rule of the incapable Charles VII. (1360-1422). In fact the year 1423 may be said to mark the lowest stage in the history of the French people. From the same year onward France, A national sentiment, as exemplified in the career of Joan of Arc (g.v.), was developed; an alliance, essential for the successful expulsion of the English from France, was made in 1435 between the king of France and the duke of Burgundy; and in 1439 the famous ordinance empowering the king to maintain a standing army and to raise money for its maintenance was passed at Orleans by the states-general. These measures proved successful; in 1453 the Hundred Years' War came to an end, and France, making between 1461 and 1483 to establish absolutism in France on sure foundations. Under his successor Charles VIII. (1483-1498), Brittany was annexed, and France, secure from all danger of a feudal reaction, entered with the invasion of Italy in 1494 by Charles VIII. upon modern times. A similar process is observable in England and Spain. In England the Wars of the Roses were followed by the establishment of a strong monarchy under Henry VII., while in Spain Ferdinand and Isabella established in place of anarchy the royal authority, and during their reign suppressed all attempts at provincial independence. In 1491 the consolidation of Spain was completed by the conquest of Granada. In 1597, by the union of Calmar, the three kingdoms of Norway, Sweden and Denmark were united under Eric XIII. This union was, however, short-lived, and in the early years of the 17th century came definitely to an end (see NORWAY; SWEDEN; DENMARK).

The close of the middle ages and the beginning of modern times was marked by several noteworthy events. The invention of printing, the discovery of America and the invasion of Italy by Charles VIII. all occurred before the end of the 15th century, while in the early years of the 16th century the ideal of civil and ecclesiastical unity was finally shattered by the Reformation and by the development of the modern states system, accompanied by the prominence henceforward attached to the question of the balance of power.

During the whole of the 15th century Europe had been affected by what is known as the Renaissance movement, which marked the transition from the medieval to the modern order. This movement, caused by the growth of learning, had its first home in Italy, which had witnessed a marvellous revival of interest in classical antiquity, in painting and in sculpture, accompanied by a keen intellectual activity in religious and political, no less than in literary matters. Criticism of existing beliefs was developed, knowledge became widely diffused, and, while the way was prepared for the substitution of individualism for the old ecclesiastical system, the development of commerce coincident with the discovery of America and the establishment of monopolistic systems destroyed feudalism (see RENAISSANCE). The later years of the 15th, and the early years of the 16th, centuries may be described as the transition from medievalism to modern times, from feudalism to individualism, from the idea of a world church and a world empire to one in which national consolidation was the chief feature and monopolistic government a necessity.

From the beginning of the 16th century Europe entered upon modern times. Many events marked the close of the middle ages. The discovery of America, the decay of Venice, the development of the European states system, the theory of diplomacy as a permanent international system (see DIPLOMACY), the wars of religion—all these are the general characteristics of the new period upon which Europe now enters. With the growth of monarchies arises the belief in the divine right of kings, the development of territorial sovereignty, and wars of ambition like those waged by Louis XIV.

With the 18th century democratic ideas first begin to appear and end by the rule of the enlightened despots such as Frederick the Great, Catherine II. and Joseph II. The outbreak of the French Revolution brings to an end the old European system, upsets the ideas on which it was founded, and leads to important territorial changes.
The advent of the Reformation, as has already been pointed out, finally shattered that ideal of civil and religious unity which had been the main characteristic of the middle ages. Thus from the beginning of the 16th century Europe sees the development of the modern state system and becomes the scene of national wars in which the idea of the balance of power was the leading principle (see Balance of Power). That principle did not allow of the recognition of the rights of nationalities, and till the wars of the French Revolution the interests of the various European states were usually subordinated to the dynastic aims of their rulers. During the ensuing century the balance of power in Europe was seriously threatened; during the first half of the 16th century by Charles V, during the latter half of the same century by Philip II, in the first half of the 17th century by the house of Habsburg, and in the latter half by Louis XIV.

The close of the Seven Years' War seemed to prelude a period of British ascendancy on the continent, but that danger passed away with the outbreak of the war between Great Britain and her American colonies. For a time the balance of power in Europe was completely shattered by Napoleon's brilliant conquests, but his fall, while to a great extent restoring the political equilibrium, gave an opportunity to Alexander of Russia to dominate Europe. Thus the 16th century definitely marked the beginning of modern times both from a political as well as from a religious point of view.

With the accession of Francis I. to the French throne Charles V. took the initiative and began the rivalry between France and the house of Habsburg, which continued with few interruptions till 1576. In the struggle between Charles V. and Francis I., which began in 1521, the former had the advantage, and the battle of Pavia (1525) seemed likely to lead to the permanent pre-eminence of the imperial cause. But unexpected allies were found by Francis in the German reformers and in the Turks. The nailing by Luther of his ninety-five theses to the door of the Wittenberg church, followed by the decisions of the diet of Worms in 1521, led to a rapid development of Lutheran opinions among the princes of the north of Germany. Charles V.'s victory over France in 1525 and his reconciliation with the papacy in 1529 seemed, however, to preclude the suppression of the Protestant opinions. But Francis I. again took up arms, while the invasions of Suleiman the Magnificent, during whose reign the Turkish power was at the zenith of its strength in Hungary and Germany but extended to the west basin of the Mediterranean, forced Charles to temporize. When in 1544 the conclusion of the peace of Crépy with Francis I. enabled Charles to turn his attention to the rapid growth of Protestantism, it was too late to adopt with any chance of success a policy of suppression. In 1552 he found himself compelled to agree to the treaty of Passau which implied the adoption of a policy of compromise, and which in 1555 was followed by a definite arrangement at Augsburg, which admitted the principle of causa regis, non religio. Till the outbreak of the Thirty Years' War in 1618, the settlement of Augsburg tended to keep peace between the Catholics and the Protestants. Equally unsuccessful were Charles's later efforts against France; in 1553 he lost Metz, Toul and Verdun, and in 1556 he retired to Spain, leaving the Empire to his brother Ferdinand, and Spain, the Netherlands and his Italian possessions to his son Philip. The latter, after winning the battle of St Quentin in 1557, made peace with the Henry II. of France by the treaty of Cateau-Cambrésis in 1559.

By this peace a term was put to the struggle between France on the one hand and the Empire and Spain on the other, and the kings of France and Spain were enabled to turn their attention to the issues raised by the immense growth of Protestantism since 1521. While Charles V. had been engaged in his struggles with the Turks and the French, Protestantism had rapidly developed. In Sweden, in Denmark, in England, in various parts of Germany, and in France Protestant principles had been largely adopted (see Reformation).

Though the forces of Roman Catholicism had for a time been weakened they had still to be counted with. From the middle of the 16th century the growth of Protestantism began to be checked, and a period of reaction against the Reformation set in. For a time it seemed that the efforts of Roman Catholicism would be successful and that the cause of Protestantism was permanently weakened. The papacy since the beginning of the 16th century had reformed itself, the council of Trent (q.v.), which closed its sittings in 1564, had given Roman Catholicism a clearly and sharply defined body of doctrine. All the Protestant churches had been subjected to a severe discipline; the Catholic Church had become "more united, less wordly, and more dependent on herself." In this work of reorganization the Jesuits had played a great part, and the success of the Counter-Reformation was largely due to their efforts (see Jesuits). Paul III., Pius IV. and V., Gregory XIII. and Sixtus V. are all good examples of the reforming popes of the 16th century. Under them the Jesuits worked; they restored Catholicism in Poland, Bohemia and south Germany; and supported by them the Inquisition crushed Protestantism out of Spain and Italy.

The interest of the Counter-Reformation movement from 1550 to 1618 centres round Philip II. of Spain. While Pius V. (1566-1572) is the best example of the Counter-Reformation popes, Philip II. took the lead among European Catholic monarchs in working for the extinction of Protestantism. His recovery of the southern Netherlands and his attempt to conquer England, his intention of subjugating France, were all parts of a scheme to advance simultaneously his own power and that of the Counter-Reformation.

Circumstances combined to aid Philip, and while he was endeavouring to carry out his political aims, the Jesuits were busy occupied in winning back large portions of Europe to allegiance to the papacy. But failure attended most of Philip's projects. Though he succeeded in recovering the southern or Walloon provinces of the Netherlands, he was unable to conquer the northern provinces, which under William of Orange themselves into the Dutch republic (see Holland: History). His scheme for the conquest of England failed, and the Spanish Armada was totally defeated in 1588. Nor was his plan for the subjection of France more successful. After a tedious civil war between the Catholics and Huguenots, Henry of Navarre in 1589 was crowned as King of France and, having overcome the armies of the League with which Philip was allied, concluded the peace of Vervins in 1598. In consenting to this treaty Philip acknowledged that his schemes for the establishment of his influence over France had failed. Thus, when the 16th century closed, England's independence was assured, the Dutch republic was established, the French monarchy was rapidly recovering from the effects of the religious wars and the decadence of the Spanish monarchy had set in. But the religious question was still unsettled, religious passions ran high, and no satisfactory agreement between Catholicism and Protestantism had been, or seemed likely to be arrived at. The successes of the Counter-Reformation under the Jesuits and such men as Ferdinand of Styria (afterwards the emperor Ferdinand II.) and Maximilian of Bavaria only roused strenuous opposition on the part of Calvinist princes such as Frederick IV., the elector palatine.

Various events had indicated the approach of a final struggle between Protestantism and Catholicism during the early years of the 17th century. The seizure of Donauwörth, a town with Protestant sympathies, by Maximilian of Bavaria in 1607, the formation of the Protestant Union in 1608 and of the Catholic League in 1609, the questions raised in 1609 by the Clevé-Jülich affair, the preparations of Henry IV. of France for an anti-Habsburg campaign—all these showed that the political atmosphere was charged with conflict. Till 1618, however, an open conflict between Protestantism and Catholicism in Germany was averted; in that year the acceptance, by the Calvinist Frederick, the elector palatine,
of the crown of Bohemia, proved the starting-point of the Thirty Years' War.

Till the death of Gustavus Adolphus in 1632 that war preserved a religious or semi-religious character. The emperor Ferdinand II., Philip III. of Spain and Maximilian of Bavaria undoubtedly hoped to suppress Protestantism in Germany, while Wallenstein, the great imperial general, was prepared to conquer Denmark, Sweden and Norway, and to convert the Baltic into an Austrian lake. Though the resistance of Christian IV. of Denmark was vain, the jealousy felt by the Catholic princes of Wallenstein and the skill of Gustavus Adolphus caused the total failure of these ambitious schemes. All hope of seeing the imperial flag waving over the Baltic was dispelled by the victory of Breitenfeld, and that of Lützen in 1632, and though Gustavus Adolphus fell in the last-named battle, he had saved north Germany from falling into the hands of the Jesuits.

With his death the Thirty Years' War became in the main a political struggle between France and the Habsburgs—a continuation of the wars of Francis I. and Henry II. against Charles V., and of the war between Henry IV. and Philip II. Ferdinand II. had attempted to carry his religious history of the Empire more than seventy years, and had failed. He had endeavoured to make the Empire a reality and to revive and carry out the designs of Charles V. His failure was now complete. The edict of Restitution issued in 1629 remained a dead letter, and from 1632 to 1648 he and his successor Ferdinand III. had to employ all their energies in defending their possessions from the attacks of the French and Swedes.

The death of Gustavus Adolphus followed in 1634 by the assassination of Wallenstein proved an admirable opportunity for the entry of France into the Thirty Years' War. And till 1648, in spite of occasional reverses, the French and their allies gradually wore down their adversaries. After the death of Henry IV. in 1610 France had temporarily retired from a foremost place in the politics of Europe, and for some thirty years her ministers were busy in coercing the Huguenots and establishing the supremacy of the crown which was threatened by the nobles. Once united at home France was ready and eager to seize the opportunity for inflicting a severe blow upon the Habsburgs in Spain and Austria. The time for such action was well chosen. Austria was weakened by the war which had been waged since 1618, while Spain, exhausted by her efforts in the preceding century, had entered upon a long period of decay, and was about to see Portugal regain its independence. The Protestant princes in the north of Germany were ready to ally with France and Sweden against the emperor, even the Catholic Bavarian duke was to prove a doubtful ally of the Habsburg house. In 1642 Richelieu and in 1643 Louis XIII. died, but though Louis XIV. was an infant, and the French nobles by their cabals hindered the work of the regency, Mazarin successfully carried out the anti-Habsburg policy of his predecessors and brought the war against Austria to a successful conclusion. (See further Thirty Years' War.)

The peace of Westphalia in 1648 marked the virtual close of religious conflicts in Europe. It also marked the end of the attempts of the Habsburgs to establish a monarchical system throughout all Germany. By that peace the practical independence of the German princes was assured. Henceforward each prince could decide what form of religion was to be observed in his dominions. Thus Lutheranism, Calvinism and Catholicism were alike tolerated, and this recognition of the principle of compromise prepared the way for a wider toleration. Moreover, the petty principalities of the Empire, which numbered over 300, were allowed the right of concluding alliances with any foreign power, of making their own laws, and of carrying on war. Thus, in consequence of this most important concession of the emperor, the Empire lost all cohesion and became little more than a confederacy. The states had firmly established their "liberties," the princes were now emancipated from imperial control, and it was evident that, unless by some means the house of Austria could re-establish its ascendency, the eventual dissolution of the Empire must sooner or later follow. The peace of Westphalia thus marks for Europe, and in a special sense for Germany, the end of an important epoch. For Germany the changes introduced into its political life amounted to nothing less than a revolution, for in its shortness the national life was broken. For Europe the Thirty Years' War brought to a close "the mighty impulses which the great movements of the Renaissance and Reformation had imparted to the aspirations" of men in all parts of the western world.

It was not, however, till the treaties of the Pyrenees (1659) and Oliva (1660) were signed that the echoes of the Thirty Years' War died away, and Europe entered upon a period in which the political ambitions of Louis XIV. threatened the interests of Europe and absorbed the attention of France and all European statesmen. During the intervening years from 1648 to 1659 Spain and France continued the struggle, while Charles X. of Sweden in 1654 entered upon a career of aggression and conquest in the north of Europe, which was only ended with his death on the 23rd of February 1660. Upon the balance of power in the north of Europe the wars of Charles X. had a permanent effect, and the peace of Oliva a great extent merely marked the restoration of the status quo. But the peace of the Pyrenees was far more important. During its struggle with France, Spain found itself also involved in hostilities with England, and the real rottenness of the Spanish monarchy became rapidly apparent. Any assistance which might have been hoped for from the emperor was prevented by the formation of leagues of German princes—lay and ecclesiastical—in 1657 and 1658, which had the full support of France. The effect of the formation of the second league was at once apparent: all hope of assistance to Spain from the emperor was seen to have disappeared, and the conclusion of a pacific settlement between France and Spain was at once arrived at. The peace of the Pyrenees was a triumph for the Rheinbund, no less than for France.

With the beginning of the personal rule of Louis XIV. in 1661, and the return of Charles II. to England in 1660, a new period in the history of personal monarchy in Europe began. At the time of the peace of Westphalia the monarchy in Europe was under a cloud. In England the cause of Charles I. was lost; in France the Fronde was holding its own against Mazarin; in Germany the princes had triumphed over the emperor; even in Russia the nobles were aiming at the curtailment of the power of the crown. But from 1660 it became evident that these attempts to secure the curtailment of the monarchical power were, with few exceptions, not destined to be successful. Though all chance of the establishment of a strong central authority in Germany had disappeared, the various states composing the Empire now entered upon a new period in their history and speedily formed miniature despotisms. Of these Brandenburg, Saxony and Bavaria were the most important. In Denmark Frederick III. made his crown hereditary, and his establishment of an absolutism was imitated by Charles XI. of Sweden a few years later.

Thus when Louis XIV. took into his own hands the government of France, the absolutist principle was triumphant all over Europe. The period of his personal rule lasted from 1661 to his death in 1715, and is known as "the age of Louis XIV." During that period France was the leading monarchy in Europe, and the most conspicuous not only in arms but also in all the arts of civilization. While Turenne, Luxembourg, Villars and many others exemplified, till the rise of Marlborough, the pre-eminence of French generals, Pascal, Racine, Corneille, Molière and Fénelon testified to the commanding position taken by France in the world of literature. The building of Versailles and the establishment of the French court there was an event of importance not only in the history of France, but also in the history of Europe. The history of Europe may without exaggeration be said during the reign of Louis XIV. to centre round Versailles.
HISTORY

During his reign France took the lead in European politics, and established her supremacy all the more easily, owing partly to the weakness of most of the European countries, partly to the aggressions of the Turks, whose invasions of eastern Europe occurred in 1683 and 1699, and partly to the Polish and of the Austrians. The weakness or neutrality of the various European states was due to various causes. England was prevented till 1689 from taking a part in opposing the ambitious schemes of Louis XIV. owing to the personal aims of Charles II. and James II. Philip IV. and Charles II. of Spain could do nothing to resist the growing ascendency of France, owing to the increasing weakness and rapid decadence of Spain, whose disappearance from the list of the great powers was the outcome of the war which started in the history of Europe during the second half of the 17th century. The weakness of Germany from the peace of Westphalia to the end of the century, due partly to the establishment of the independence of the princes of the Empire, partly to the unrest in Hungary, partly to the aggressions of the Turks, was obviously an immense gain to Louis XIV.

Realizing the strength of his own position and the weakness of that of most of the European states, he entered in 1667 into his war against the United Provinces of the Dutch. From 1667 to 1672 he was again at war with Holland, and from 1673 with the emperor, Spain and Brandenburg as well. At the same time the Turks invaded Poland, but were successfully resisted by John Sobieski. In 1676, however, they made the favourable treaty of Zurbawa, securing Kamenets and portions of Podolia and the Ukraine. Thus, while the Turks were threatening the independence of eastern Europe, Louis XIV. was attacking the independence of western Europe. In 1678 he made the treaty of Nijmegen, securing great advantages for France. Till the end of the century Europe was faced with two serious problems: Could she successfully cope with the Turks on her eastern frontier? And could she resist the continued aggressions of France on her western frontier? Consequently the years from 1678 to the end of the century were of vital importance to the European world. For during that period the French and Turks made unceasing efforts to extend their frontiers at the expense of Germany. Encouraged by the weakness of the chief European states, Louis set up the Chambers of Reunion, seized Strasburg in time of peace and attempted to annex Luxemburg. At the same time it seemed that an independent Gallican Church would be set up, and that Louis, like Henry VIII., would sever all connexion with Rome. The persecution of the Jansenists and the revocation of the edict of Nantes in 1685 established some thing like religious uniformity in France. Buoyed up by his successes abroad and at home, conscious that he had nothing to fear from England or from Spain, Louis prepared to carry out his schemes, with regard to the extension of his territory eastwards, at the expense of Germany. Simultaneously with Louis' aggressions in western Europe, the Turks had made an attempt to capture Vienna in 1683. Fortunately the efforts of the emperor Leopold, aided by John Sobieski, king of Poland, were successful, and the Turkish tide of conquest was gradually but successfully checked. It was not, however, till the accession of William III. to the English throne that the tide of French conquest in western Europe was in like manner successfully resisted, and it was not till the treaty of Ryswick in 1697 that Louis realized that Europe had set a limit to his conquests. That treaty inflicted a blow on the prestige of France, just as the treaty of Karlowitz, concluded in 1699, was an important step in the decline of the Ottoman power. By that treaty a formal recognition was accorded to the Austrian monarchy, the hands of the emperor were freed, and he was able to devote his attention to the Spanish succession question, which already engrossed the attention of all Europe. The decadence of Spain had been obvious to all Europe since the middle of the century, and in anticipation of the death of the Spanish king Charles II., Louis XIV. and William III. had made a partition treaty in October 1668, which was superseded in March 1700 by a second partition treaty. However, on the death of King Charles on the 1st of November 1700 Louis repudiated the partition treaties and accepted the crown of Spain for his grandson Philip, who became Philip V. of Spain. Not content with this success Louis commenced negotiations for the partition of the Spanish Succession in 1702. That was continued till 1713, when the treaty of Utrecht, followed in 1714 by the treaties of Rastadt and Baden, ended a struggle which had many results of vital importance to Europe. Great Britain, strengthened by the possession of Gibraltar and Minorca, by her establishment in Canada, and by trading rights in South America, hecastforward stood forth as a rising colonial power to whom the command of the seas was assured, and which was obtained not only Belgium, which she held till the French Revolution, but also a firm foothold in Italy, which she maintained till 1859. To Spain the war indirectly brought unexpected benefits. Freed from her expensive possessions in Belgium and Italy, and now ruled by a new dynasty, Spain, so far from meeting with the fate which later attended Poland, entered upon a new period in her career, and throughout the 18th century showed considerable power of resistance to the colonial policy of Great Britain.

With all its defects the Peace of Utrecht proved in many ways an excellent settlement. Till 1740, although a few short wars took place, Europe as a whole enjoyed peace. But with the settlement of Utrecht Europe seemed to have lost all touch with the high ideals which occasionally, as in the career of Gustavus Adolphus, or in the English great rebellion, or in the defence of Vienna by John Sobieski, were met with. The 18th century was marked by the dominance of a perverted system of the balance of power, which regarded such acts as the Prussian seizure of Silesia and the partition of Poland as justifiable on the ground that might is right. Before many years had passed after the treaty of Utrecht it became evident that two new nations were forcing themselves into the front rank of European powers. These were France and Russia. The treaty of Nystadt in 1721 was to the north of Europe what the treaty of Utrecht was to the western and southern nations. It marked the decline of Sweden and the rise of Russia, which henceforth played an important part in European politics. Nevertheless till 1740 with the exception of the short Polish Succession War in 1733-35 and the equally short war of 1737-39, in which Russia and Austria fought against Turkey, no general European struggle took place. That this was so was due in great measure to the alliance of 1717 between Great Britain and France, to the subsequent peace policy upheld by Walpole, Fleury, Pathé and Horn (the English, French, Spanish and Swedish ministers), to the hostility between the courts of Vienna and Madrid—only momentarily healed by the treaty of Vienna in 1725—and to the uncertain character of Russian politics.

During those years from 1733 to 1740 the great powers were slowly forming themselves into groups, bound together by motives of interest. Thus Spain and France after 1729 began to realize that both countries were interested in checking Great Britain's colonial developments, while Spain was also ready to seize every opportunity of increasing her possessions in Italy at the expense of Austria.

With the year 1740 Europe entered upon a new epoch. The rivalry of Austria and Prussia for the leadership of Germany definitely began, and the struggle between Great Britain and France for supremacy in India, Canada and the West Indies entered upon an acute phase. The War of the Austrian Succession (1740-48) holds therefore an important place in the history of Europe, and proved with the Seven Years' War, was practically a continuation of it, of very real interest to Europe.

In April 1748 Great Britain, France and Holland signed preliminaries of peace, which on the 8th of October became the definitive treaty of Aix-la-Chapelle. The other powers concerned agreed to the treaty with reluctance, Spain on the 29th of October, Austria on the 8th of November, and Sardinia on the
20th of November. By the terms of the peace France and Great Britain restored the conquests in America, India and Europe which each had made from the other. As regards the other powers, the peace left serious heart-burnings. Sardinia, though gaining territory in the Milanese, No. 31, which beheaded the Papacy and restored Piacenza to its territory, and to restore Finale to Genoa; Austria had to yield Parma and Piacenza to Don Philip, and to recognize the loss of Silesia to Prussia; Spain was compelled to forgo all hope of regaining Gibraltar. The importance of the terms of this treaty lies in the fact that they indicate not only the lines followed by later European settlements, but also the tendency of later European developments. To Great Britain the treaty was only a pause in, her expansion in Canada and in her advance to the establishment of her influence over all India. To France the treaty was equally a presage of future disasters in India and Canada. The retention of Silesia by Prussia was a pronounce ment to all Europe that a new power had arisen which was destined in 1866 to oust Austria from her dominant position in Germany. The gains won by Sardinia, too, indicated that the real danger to Austria's position in Italy would come from the house of Savoy.

The Seven Years' War (1756–63) opened with a diplomatic revolution as important as that of 1717, when France and Great Britain made an alliance. In May 1756, as a reply to the treaty of Westminster the Second, made in January between Great Britain and Prussia, France and Austria, united in the treaty of Versailles. This unexpected union, which lasted till the French Revolution, between two powers which had been hostile to each other from the beginning of the 16th century, amazed all Europe. However, it had not the results expected, for although Russia, which was allied with Austria, sent large armies headed by capable generals to the war, Frederick the Great remained unconquered. This result was partly due to the English alliance, partly to the incapable French generals, and partly to the state of internal politics in Russia. The treaties of Paris (February 10, 1763) and Hubertburg (February 19) marked an important stage in the history of Europe. By the first Great Britain emerged from the war an imperial power with possessions all over the world, by the second Prussia was recognized as the equal of Austria in Europe.

The treaty from the close of the Seven Years' War to the French Revolution saw all the special characteristics and tendencies of the 18th century in an accentuated form. Benevolent despots found representatives not only in Frederick the Great and Maria Theresa, but also in Joseph II., Carl XII., Charles III. of Spain, and Leopold of Tuscany. Reforming ministers, too, flourished in the persons of Tanucci, Turgot, Squillaci, Florida Blanca, D'Aranda and many others. Instances, too, of the low level of political morality are to be found. The indefensible seizure of Silesia by Frederick the Great was followed in 1772 by the equally immoral partition of Poland, and it was clearly apparent that monarchs, though ostensibly actuated by a desire for the welfare of their subjects, were resolved that forms should come from above and not from below. The chief European events during these years were (1) the partition of Poland; (2) the war of the Bavarian Succession; (3) the alliance of Russia with Prussia in 1764 and with Austria in 1781; (4) the entry of France and Spain into war between Great Britain and her American colonies; (5) the combined attack of Russia and Austria against Turkey (1787–92); (6) the Triple Alliance of 1788. No sooner was the Seven Years' War ended than France and Spain, having made the third family compact in 1761 (the other two were signed in 1733 and 1743), prepared to take revenge upon Great Britain at the first favourable opportunity. The result of this determination, and of Great Britain's absorption in internal politics, was that Russia, Prussia and Austria were enabled to carry out the first partition of Poland in 1772.

The entry of France into the American war of independence rendered it impossible for Joseph II., single-handed, to carry out his project of exchanging the Austrian Netherlands for Bavaria, and he was compelled, after a short war, to give up for the time his project and to agree to the treaty of Teschen (1779). The continuance of the American War proved of great value to Russia and enhanced her position in Europe. Not only had she, together with France, brought about the treaty of Teschen, but she was enabled to rely on her allies to maintain her position in Europe. From 1780 and 1784 annexed the Crimea. The conclusion of the war of American Independence enabled Great Britain to regain her influence in Europe, and when Russia and Austria combined to attack Turkey, and when France threatened to re-establish her influence in Holland, Pitt formed with the Prussian king and the stadtholder the famous Triple Alliance of 1788. During the ensuing four years the influence of that alliance made itself felt. All the powers were divided for or against it. All but Austria, however, were divided against it. The influence of French influence in Holland was destroyed; Denmark was forced to relinquish an attack on Sweden, then at war with Russia; and after Leopold of Tuscany had succeeded Joseph II. as emperor in 1790, the revolution in the Netherlands was brought to an end. Moreover, through the influence of Leopold the hostility of Prussia to Austria was removed, and the two powers in July 1790 made the treaty of Reichenbach. Great Britain, the chief member of the Triple Alliance, had supported the pacific solution of all these questions so menacing to European peace, and Pitt was aided in his policy by the emperor Leopold, who in 1791 made the treaty of Sistova with the Turks. Danger to the peace of Europe was, however, caused by the attempt of the Spaniards to annex Nootka Sound, and by the continuance of the war between Russia and Turkey. The former difficulty was, however, removed in November 1790 by an agreement between Great Britain and Spain. And in January 1792 Russia made the treaty of Jassy with Turkey.

Instead of Europe remaining at peace the year 1792 saw the beginning of a series of wars which did not come to a final conclusion till the battle of Waterloo. While the east of Europe was engaged in war, and while the Triple Alliance was busy attempting to restore peace to Europe, the French Revolution had broken out in 1789. The French Revolution had thus broken out in 1789. The assistance given by France to the American colonists had brought the country to bankruptcy, and no course was left to Louis XVI. except to summon the states-general in May 1789. In that year a revolution against the reforms of Joseph II. had taken place in the Netherlands, and a revolution was being prepared in Poland for the overthrow of the aristocratic constitution and for the establishment of an hereditary monarchy. At first the revolution in France was entirely occupied with internal reforms, but after the disorganization of the Constituent Assembly in September 1791 the Girondists, whose influence before had been undermined by the advice of Brissot to insist upon a policy of menace towards the Empire which would inevitably lead to war. War would, they hoped, result in the downfall of monarchy in France. On the other hand, Lafayette and his party advocated war on the ground that it would strengthen the cause of monarchy. In April 1792 war was accordingly declared upon Austria, then in alliance with Prussia. After a short period of failure the French in September won the battle of Valmy, and in November the battle of Jemappes. French armies advanced to the Rhine, Belgium was occupied, the Scheldt was declared open, and Holland was threatened. In consequence of the danger to Holland, Pitt adopted a warlike tone, and in February 1793 France declared war upon Great Britain. In that war Spain, Sardinia and Tuscany joined, so that France was practically fighting all Europe. Nevertheless, owing to the want of union among the allies, the whole of the Polish question which distracted Prussia and Austria, and to the determination and patriotism of all classes in France, the allies were discomfited and the league of powers broken up in 1795, when the treaties of Basel were made. Only Great Britain, Austria and Sardinia remained in arms against France, which was till 1799 ruled by the Directory. The next few years witnessed a series of most startling events. The successes of Napoleon, Bonaparte in the Italian campaign of 1797 and 1798 led to the peace of Kreuznach with Sardinia,
and the peace of Campo Formio with Austria. Only Great Britain remained at war with France. In 1799, taking advantage of the absence of Napoleon in Egypt, the Second Coalition was formed by Russia, Great Britain, and Austria. Though the French were driven from Italy, Massena defeated the Russians in Switzerland, and the English were forced to retire from Holland. The return of Napoleon from Egypt was followed by the establishment of the Consulate in November 1799, by the overthrow of the Austrians at Marengo and Hohenlinden, by the treaty of Lunéville with the emperor, and by the treaty of Amiens in 1802 with the English government. (See FRENCH REVOLUTIONARY WARS.)

Up to this point the Revolution may be said to have benefited Europe in its rejection of the despotic and militaristic character of the French Revolution. During the years succeeding the peace of Campo Formio a revolution was effected in Germany. The Holy Roman Empire had become an anachronism, and as soon as France became possessed of the left bank of the Rhine it was obvious that the imperial constitution required revision. The jealousies existing among the German princes and the overthrow of Austria at Austerlitz enabled Napoleon to carry out a revolution in Germany according to his own ideas. At first, in 1804, new arrangements were made with regard to the character and formation of the diet. The constitution of that assembly was so altered that a Protestant majority free from Austrian influence was now assured. The middle states, such as Prussia, Baden, Bavaria, Württemberg and Hanover, received additions of territory, taken either from the ecclesiastical states or from the lands belonging to the imperial knights. After Austerlitz Napoleon in 1806 established the Confederation of the Rhine, and the Holy Roman Empire came finally to an end. A great European revolution had now been effected, but much remained to be done before a feeling of nationality could be aroused among the people of central Europe.

Already before the peace of Amiens Pitt had tried to stir up national feeling in Austria and Prussia, the means which he suggested for opposing Napoleon being in great measure those which were adopted in 1813 and 1814. But during Pitt’s lifetime central Europe was not moved by any feeling of nationality or of patriotism. The causes of Napoleon’s success. During the war of the Second Coalition in 1799 Austria had acted without any regard for her allies, while Prussia, from motives of jealousy of and from want of confidence in Austria, had refused to move. It was not till the small states which hitherto had formed independent units had been destroyed and Austria and Prussia trampled under foot by Napoleon that a strong national spirit in Germany was evoked. Until the treaty of Tilsit had been signed, there was no chance of a national uprising in any part of Europe. During the intervening years Prussia had been crushed at Jena and her kingdom cut short (1806), while Alexander I. of Russia, after a fierce campaign against Napoleon, had agreed in 1807 to the treaty of Tilsit, which apparently placed Europe at the feet of France and Russia. Napoleon was, as he thought, now in a position to bring about the humiliation of Great Britain. Already in November 1806, realizing that he could not ruin England by direct invasion, he had issued the first Berlin Decree, which ordered the exclusion of British goods from the continent. The Continental System necessitated by the victory of Trafalgar was thus definitely set up. After Tilsit he proposed to become supreme in the Baltic, and, by securing the dependence of Spain and Portugal, to dominate the Mediterranean, and to resume his plans for conquests in the East, and for the destruction of the British power in India. Thus the effects of the British naval victories of the Nile and Trafalgar would be completely nullified, the Mediterranean would be closed to British ships, Great Britain’s Indian possessions would be lost, and Great Britain herself would be forced by starvation to surrender. Fortunately for Europe various circumstances hindered the realization of these ambitious schemes. Alexander, who feared that the French emperor desired Constantineople, never proved a very helpful ally, the measures taken by Great Britain seriously interfered with Napoleon’s schemes, and, before he had subdued Spain, first Austria in 1809 and then Russia in 1812 offered an active resistance to his projects. The first note of opposition to Napoleon’s plans was struck by Canning, when in 1807 he carried off the Spanish fleet to England. Napoleon sent to Brazil in safety the Portuguese royal family when Portugal was invaded by Junot, while the surrender of 30,000 French troops at Baylen in July 1808, which was followed in August by the convention of Cintra, indicated that Spanish patriotism was, when roused, as effective as in the days of the Spanish Succession War. Austria was the first country to follow the example of Spain, and though she was defeated at Wagram and forced to restore the nation to its 18th-century constitution, her government. During the years 1810 and 1811 rapidly developed. But Napoleon was apparently unconscious of the growth and importance of a national sentiment in any of the subject countries. In 1810 he married Marie Louise of Austria, on the 20th of March 1811, a son was born to him, and he now seems to have resolved upon the establishment of a strictly hereditary empire with Paris its capital and Rome its second city. In extent, his empire would be vaster than that of Charlemagne, and the pope was to be completely subordinate to the emperor. This conception of the establishment of a reformed Holy Roman Empire with its centre at Paris did not appear unrealizable in 1811 when everything seemed to favour the new Charlemagne. Napoleon’s power was apparently securely established, and during the years 1810 and 1811 he was again returning to his vast oriental design. A sudden check, however, was about to be placed upon his ambitious schemes.

The establishment of French influence in Italy and Germany had stirred up in both countries a national feeling, the growth of which was encouraged by the example of Spain. No greater mistake was ever made by Napoleon than when, ignoring the strength of the Spanish resistance, and the development of a national movement in Germany, he resolved to enter upon the Russian campaign and to march to Moscow. Unconsciously Napoleon “had called into vigorous life the forces of Democracy and Nationality in Germany and Italy.” The failure of the Moscow campaign led at once to a national rising in Prussia, and as soon as Austria had united her forces with those of Prussia and Russia, the overthrow of Napoleon at Leipzig in October 1813 was the result, and “the imperial yoke was shaken from the neck of the German people.” Napoleon’s wars had roused feelings of patriotism in Italy, Germany, Russia and Spain. It was at least realized by the nations of continental Europe, what had long been apparent to England, that a struggle for the future in Europe must be a struggle for the right and not for the balance of power. The “subversive cosmopolitanism” of the French Revolution was now opposed the modern ideas of nationality, against which the Napoleonic legions hurled themselves in vain. (See NAPOLEON I; NAPOLEONIC CAMPAIGNS; FRENCH REVOLUTION; ALEXANDER I., emperor of Russia; METTERNICH.) (A. H.)

The downfall of Napoleon involved that of the political system of Europe which he had constructed. The changes wrought by the revolutionary period in the old states system were, however, too profound to admit of any attempt at a complete restoration, even had the interests of the allied powers been consistent with such a course.

The object of the four great powers in whose hands the settlement of Europe now lay, was rather, after taking precautions to confine France within her “legitimate boundaries,” to arrange such a “just equilibrium” in Europe that no individual state should for the future be in a position to overawe the balance of power. The first object was to be attained by the re-establishment of the ancient dynasty in France, as a guarantee to Europe against a renewal of the revolutionary propaganda; the second was the work of the congress of Vienna, by which, between September 1814 and June 1815, the reconstruction of Europe was taken in hand. The opening of the congress, in which for the first time all Europe seemed to be united for the friendly settlement of common
interests, was hailed as the dawn of a new era. In a sense it was so; but hardly in the manner nor to the degree that some had hoped. In its councils the arts of the old diplomacy, still inspired by the traditional principles or lack of principles, were directed to the old ends; and the world, as though the popular upheaval of the Revolution had never been, was treated as real estate to be parcelled out by the executors of Napoleon's empire among sovereigns by divine right, regardless of the wishes of the populations, which figured in the protocols merely as numbers to be balanced and bartered one against the other.

This process of 'dividing the spoils,' as Gantz called it, was naturally pregnant with possibilities of quarrels. Of these the most dangerous was that provoked by the resolution of the emperor Alexander I. at all costs to keep the former grand-duchy of Warsaw for himself, while compensating Prussia for the loss of some of her Polish territories by the annexation to her of all Saxony. The deadlock caused by the stubborn insistence on this plan, which the other great powers were equally determined to frustrate, but all led to war, and by a secret treaty signed on the 3rd of January 1815, Great Britain, France, and Austria agreed to make common cause in that event against Russia and Prussia. It needed Napoleon's return from Elba (March 1815) to confirm his promise that their interests were subordinated to those of Europe. The common peril restored the broken harmony; and while the armies of the Alliance were closing in for the final struggle with the French emperor, the congress hurried on its deliberations, and on the 9th of June 1815, a few days before the battle of Waterloo, by which Napoleon's power was finally shattered, the Final Act, embodying the treaties of Vienna, was signed.

The territorial arrangements thus effected were for half a century the basis of the states system of Europe, and the treaties in which they were defined the charter of international relations. It was in central Europe, where Napoleon's policy had most profoundly affected the pre-revolutionary system, that the greatest changes were made. No attempt, indeed, was made to restore the Holy Roman Empire, in spite of the protest of the pope against the failure to re-establish "the centre of political unity"; but the Confederation of the Rhine having come to an end, Germany was reconstituted as a confederation of sovereign states, in which all the former members of the Empire which had survived the revolutionary epoch found a place (see Germany). Austria, in virtue of the imperial tradition of the house of Habsburg, received the presidency of the federal diet; but the bulk of her territories lay outside the frontiers of the Confederation, and the non-German character of the Habsburg monarchy was at once attested by the arrangements at the congress. In Italy Lombardo-Venetia was retained by the French, and the kingdom under the Austrian crown; while the dynastic settlements in the other Italian states tended to make Austrian influence supreme in the peninsula (see Italy). In return for this, Austria surrendered her claim to her former possessions in the Low Countries, which were annexed to the crown of Holland, so as to form, under the title of the United Netherlands, an efficient barrier to French aggression northwards. The function of defender of Germany on the Rhine frontier which Austria thus abandoned was assigned to Prussia, an arrangement pregnant with momentous issues. In compensation for her disappointment in the matter of Saxony, half of which was ultimately restored to the dynasty of Wettin, she received a large accession of territory in the Rhine provinces, carved partly out of the suppressed kingdom of Westphalia, partly out of the former ecclesiastical states, and comprising the imperial city of Aix-la-Chapelle and the former electorate of Cologne. To Prussia also was conceded the right to garrison the federal fortress of Luxembourg.

Of the other German states, Bavaria, which alone was sufficiently powerful to be of any great importance in the general affairs of Europe, reaped the reward of her timely defection from the cause of her protector Napoleon. She had, indeed, to restore to Austria the territories annexed to her at the expense of the Habsburg monarchy by the French emperor: Töl, the Quarters of the Inn and of the Hauruck, and part of Salzburg. But she received ample compensation elsewhere, notably the former Bavarian Palatinate with a strip of territory to connect it with Bavaria proper. The right to garrison the federal fortress of Mainz was also ultimately conceded to her. Bavaria was thus in a position to vindicate her traditional policy of aiming at the position of a European great power and holding the balance between Austria and Prussia (see Bavaria: History). The two other German states whose elevation to kingdoms had symbolized a similar ambition, Saxony and Württemberg, were henceforth relegated to a position of third-rate importance; Saxony dependent for her very existence on the rivalry of her more powerful neighbours: Württemberg protested in vain against the dictatorship of the great powers to which she was forced to submit. Finally, the electorate of Hanover, partly out of compliment to the king of Great Britain, partly because with the abolition of the Holy Empire the title elector had fallen obsolete, was elevated to a kingdom. The request of the elector of Hesse for a similar concession in his case was refused by the powers assembled at Aix-la-Chapelle in 1818.

Of great importance were the changes effected in the north east of Europe. The affairs of the Ottoman empire, which had been left in a very unsatisfactory condition, were not dealt with by the congress, in spite of the efforts of Great Britain to bring them into discussion. But the concessions made to the emperor Alexander elsewhere represented a notable advance in the European position of Russia. The possession of Finland, conquered from the Swedes in 1808, was confirmed to her; and, above all, the cession of the former grand-duchy of Warsaw into a constitutional kingdom of Poland under the Russian crown not only thrust the Muscovite power like a wedge into the heart of Germany, but seemed to threaten the Polish possessions of Austria and Prussia by setting up a quasi-independent Poland as a centre of attraction to the scattered elements of the Polish nation; though in the sequel the establishment of the city of Cracow and its territory as an independent republic, to avoid the difficult question of its assignment elsewhere, proved a more fruitful source of national unrest. In the north the settlement confirmed by the congress marked the definite withdrawal of the Scandinavian Powers from any active influence on the affairs of the continent. Alone of the parvenu monarchs of the Napoleonic age Bernadotte retained the crown of Sweden, to which, by the treaty of Kiel, that of Norway had been added. On the other hand, by the cession of Swedish Pomerania to Prussia, Sweden finally withdrew from the southern shores of the Baltic. The Scandinavian states ceased henceforth to play any important part in European politics. On the other hand, the restoration of Savoy and Piedmont to Victor Emmanuel I., king of Sardinia, and the incorporation in his dominions of the territories of the former republic of Genoa, were factors pregnant with mighty issues. The object of this increase of the power of the house of Savoy was but to erect a barrier against any possible renewal of French aggression in Italy; in effect it established the nucleus of the power which placed in a position to continue her traditional policy of aiming at least some of the territorial gains of the revolutionary wars; though Napoleon had thrown away, during the negotiations at Châtillon, the chance of preserving for her "natural frontiers" of the Rhine, the Alps and the Pyrenees. After Napoleon's second downfall she was in serious danger of dismemberment, for which the German powers
clamoured as essential to their safety. That Louis XVIII. continued to rule over the territories "handed down to him by his ancestors" was due to the magnanimity, or policy, of the emperor Alexander I. (q.v.), and the common sense of Castlereagh and Wellington, who saw well that the "just equilibrium," which was to keep the "diabolically discordant and disunited" states of Europe, was being undermined, and that peace could never be preserved if the French people were left to smart under a sense of permanent injury. By the second peace of Paris, signed on the 20th of November 1815, France retained her traditional boundaries. The un gestión ambition to secure her "national frontiers" was to bear troublesome fruit later.

That the treaties embodied in the Final Act of Vienna represented a settlement of all outstanding questions was believed by nobody. They had been negotiated for weary months in an atmosphere of diplomatic and feminine intrigue; they had been concluded in a hurry, under the influence of the panic caused by Napoleon's return from Elba. To Friedrich von Gentz they were at best but "partial arrangements," useful as forming an authoritative basis for the establishment of a more complete and satisfactory system. The history of the international politics of Europe for the year immediately succeeding the congress of Vienna is that of the attempts to establish such a system.

After a quarter of a century of almost ceaseless wars, what Europe needed above all things was peace and time to recuperate.

The treaty was not a treaty at all, but at best a declaration of principles to which any Christian could subscribe, at worst—to quote Castlereagh—"a piece of sublime mysticism and nonsense" from the political point of view (see HOLY ALLIANCE). It gained its sole political importance from the persistent efforts of the tsar and his ministers to replace the committee of the great powers, established by the treaty of the 30th of November, by a "Universal Union" of all the powers, great and small, who had signed the Holy Alliance, and thus to establish that "Confederation of Europe" of which the autocratic idealist had borrowed the conception from the theorists of the 18th century (see ALEXANDER I., emperor of Russia). It was clear from the first that any attempt to set up such a central government of Europe would involve a "universal guarantee" would impair the independence of the sovereign states; and from the first Great Britain, represented by Castlereagh, protested against it. She would consent to take common action on the basis of the treaties she had actually signed, consulting with her allies on each case as it arose; but to vague and general engagements she refused to commit herself. The attitude of Austria and Prussia was from the outset less clear. Metternich was torn between dread of revolution and dread of Russia; the Holy Alliance, though essentially "verbiage," might be useful in holding the imperial Jacobin in check; the "universal guarantee" could not but be discouraging to the "sects"; on the other hand, the extreme willingness of the tsar to march 200,000 Russians for any "European" purpose in any direction convenient or inconvenient to Austria, was—to say the least—disconcerting. Wellington did not entirely trust the tsar's word, but he thought he had signed the Holy Alliance with reluctance, in moments of panic saw in the "universal guarantee" his best defence against the renewed attack by France which was his nightmare. In effect, owing to the firm attitude of Castlereagh at the congress of Aix-la-Chapelle, the transparence soul of the Holy Alliance never received a body, though attempts were subsequently made at the congresses of Troppau, Laibach and Vienna to apply some of its supposed principles— attempts that led to the definite breach of Great Britain with the Alliance.

The highwater-mark of the activity of the Allies as a central government for Europe was reached at the congress of Aix-la-Chapelle (q.v.) in 1818. France was now admitted to the Alliance, the objects of which were reaffirmed in a public declaration to which she adhered; but at the same time a secret treaty removed the compact of Chaumont between the four other powers. Certain questions outstanding from the congress of Vienna were referred for settlement to a ministerial conference to meet at Frankfort in the following year. The treaty which was the result of this conference was signed on the 20th of July 1819. The bulk of it was concerned with territorial settlements in Germany: between Austria and Bavaria, and Bavaria and Baden; but some of the articles arranged for the cession of the border fortresses Phillipville and Marienburg to the Netherlands defined the frontiers of Savoy, and settled the revision of the Italian duchies held by the empress Marie Louise.

Meanwhile the balance of forces within the European concert had shown a tendency to shift. At the outset the restless activity of the emperor Alexander, his inculcable idealism, and his hardly veiled ambitions had drawn Austria and Great Britain together in common suspicion of an influence that threatened to be little less disturbing to the world's peace than that of Napoleon. But at Aix Metternich had been to realize that, in the long-run, the system of repression which he held to be essential to the stability of the European, and above all of the Austrian, polity would receive little effective aid from Great Britain, lettered as she was by constitutional forms; while Alexander, alarmed at the discovery of revolutionary plots against his person, had come to share the Emperor Francis', and signified by him, the emperor Francis, and King Frederick William III. of Prussia on the 26th of September 1815, represented a different and conflicting ideal. Actually it was not a treaty at all, but at best a declaration of principles to which any Christian could subscribe, at worst—to quote Castlereagh—"a piece of sublime mysticism and nonsense" from the political point of view (see HOLY ALLIANCE). It gained its sole political importance from the persistent efforts of the tsar and his ministers to replace the committee of the great powers, established by the treaty of the 30th of November, by a "Universal Union" of all the powers, great and small, who had signed the Holy Alliance, and thus to establish that "Confederation of Europe" of which the autocratic idealist had borrowed the conception from the theorists of the 18th century (see ALEXANDER I., emperor of Russia). It was clear from the first that any attempt to set up such a central government of Europe would involve a "universal guarantee" would impair the independence of the sovereign states; and from the first Great Britain, represented by Castlereagh, protested against it. She would consent to take common action on the basis of the treaties she had actually signed, consulting with her allies on each case as it arose; but to vague and general engagements she refused to commit herself. The attitude of Austria and Prussia was from the outset less clear. Metternich was torn between dread of revolution and dread of Russia; the Holy Alliance, though essentially "verbiage," might be useful in holding the imperial Jacobin in check; the "universal guarantee" could not but be discouraging to the "sects"; on the other hand, the extreme willingness of the tsar to march 200,000 Russians for any "European" purpose in any direction convenient or inconvenient to Austria, was—to say the least—disconcerting. Wellington did not entirely trust the tsar's word, but he thought he had signed the Holy Alliance with reluctance, in moments of panic saw in the "universal guarantee" his best defence against the renewed attack by France which was his nightmare. In effect, owing to the firm attitude of Castlereagh at the congress of Aix-la-Chapelle, the transparence soul of the Holy Alliance never received a body, though attempts were subsequently made at the congresses of Troppau, Laibach and Vienna to apply some of its supposed principles— attempts that led to the definite breach of Great Britain with the Alliance.

The highwater-mark of the activity of the Allies as a central government for Europe was reached at the congress of Aix-la-Chapelle (q.v.) in 1818. France was now admitted to the Alliance, the objects of which were reaffirmed in a public declaration to which she adhered; but at the same time a secret treaty removed the compact of Chaumont between the four other powers. Certain questions outstanding from the congress of Vienna were referred for settlement to a ministerial conference to meet at Frankfort in the following year. The treaty which was the result of this conference was signed on the 20th of July 1819. The bulk of it was concerned with territorial settlements in Germany: between Austria and Bavaria, and Bavaria and Baden; but some of the articles arranged for the cession of the border fortresses Phillipville and Marienburg to the Netherlands defined the frontiers of Savoy, and settled the revision of the Italian duchies held by the empress Marie Louise.

Meanwhile the balance of forces within the European concert had shown a tendency to shift. At the outset the restless activity of the emperor Alexander, his inculcable idealism, and his hardly veiled ambitions had drawn Austria and Great Britain together in common suspicion of an influence that threatened to be little less disturbing to the world's peace than that of Napoleon. But at Aix Metternich had been to realize that, in the long-run, the system of repression which he held to be essential to the stability of the European, and above all of the Austrian, polity would receive little effective aid from Great Britain, lettered as she was by constitutional forms; while Alexander, alarmed at the discovery of revolutionary plots against his person, had come to share the Emperor Francis', and signified by him, the emperor Francis, and King Frederick William III. of Prussia on the 26th of September 1815, represented a different and conflicting ideal. Actually it was not a treaty at all, but at best a declaration of principles to which any Christian could subscribe, at worst—to quote Castlereagh—"a piece of sublime mysticism and nonsense" from the political point of view (see HOLY ALLIANCE). It gained its sole political importance from the persistent efforts of the tsar and his ministers to replace the committee of the great powers, established by the treaty of the 30th of November, by a "Universal Union" of all the powers, great and small, who had signed the Holy Alliance, and thus to establish that "Confederation of Europe" of which the autocratic idealist had borrowed the conception from the theorists of the 18th century (see ALEXANDER I., emperor of Russia). It was clear from the first that any attempt to set up such a central government of Europe would involve a "universal guarantee" would impair the independence of the sovereign states; and from the first Great Britain, represented by Castlereagh, protested against it. She would consent to take common action on the basis of the treaties she had actually signed, consulting with her allies on each case as it arose; but to vague and general engagements she refused to commit herself. The attitude of Austria and Prussia was from the outset less clear. Metternich was torn between dread of revolution and dread of Russia; the Holy Alliance, though essentially "verbiage,"
peaceful means, or if need be by arms, to bring back the guilty
state into the bosom of the Great Alliance.

This was, in effect, an attempt to apply the principle of the
Carlist Decrees to all the world; and, had the attempt suc-
cceeded, all Europe would have been turned into a confederation
on the model of that of Germany; for a political system charged
with the safeguarding of the territorial settlement
defined by treaty, would have been substituted a central diet
define the great powers, armed with undefined authority; and
the sovereign independence of the nations would have been an end.
to any such principle, and therefore to the protocol in
which it was embodied, Great Britain offered an uncompromising
opposition. In vain Metternich urged upon Castlereagh that the
protocol was the logical corollary of the logical corollary drawn
necessary to which he was already committed; for, if the alliance was to be
effective in maintaining peace, it must interfere wherever and
whenever peace should be threatened, and therefore to crush
internal revolutions which could not but have an external result.
The logic was perfect; the proposition that on which every
"project of peace" must eventually break. Castlereagh's reply
was, in brief, that Great Britain could never admit a principle
which she would not in any circumstances allow to be applied in her own case.

The absence of the signatures of Great Britain and France
from the Troppau protocol marked the first rift in the alliance,
a rift that was soon to develop into a breach. For the
first time, indeed, the crack was "papered over." Castle-

eragh was prepared to leave Austria a free hand to
deal with the rising in Naples and Piedmont, since
she had treaty rights in the former case and her interests, as an
Italian power, were threatened in both. Great Britain was even
represented at the congress which reassembled at Laibach in
January 1821, though Lord Stewart, the ambassador at Vienna,
was not armed with full powers. Castlereagh had
approved of the invitation sent to the king of Naples to
attend the congress, as implying "negotiation," an
improvement on the dictatorial attitude of the protocol.

But everything in the conferences tended still further to shatter
the unstable foundations of the alliance. Capo d'Istria, as though
the debates at Aix-la-Chapelle had never been, raised once more
the spectre of the "Universal Union" which Castlereagh
believed he had laid for ever. Metternich, anxious to prove to
the Italian Liberals that the tsar was no longer their friend,
welcomed the demonstration, and Prussia followed obediently
in Austria's wake. "It is clear," wrote Lord Stewart, "that a
Triple Understanding has been created which binds the parties to
carry forward their own views in spite of all forms of
dissent and that the two great constitutional governments." (See Twopau and Laibach.)

But the narrower "Holy Alliance" of the three autocratic
monarchies, as opposed to the two western constitutional
monarchies, was not in fact destined to take shape
till after the Paris revolution of 1830. Several factors
delayed the process, notably the revolt of the Greeks
against the Ottoman rule, and the Spanish question,
which latter formed the main subject of discussion at the con-
gress of Verona in 1822. In the Eastern Question the interests
of Austria and Great Britain were identical; both desired to
maintain the integrity of Turkey; both saw that this integrity
was in the greatest peril owing to the possible intervention of the
Orthodox tsar in favour of his co-religionists in revolt; and both
agreed that the best means of preventing such intervention was
to bind the Russian emperor to the European concert by using his
devotion to the principles of the Holy Alliance. At Verona,
however, the Eastern question was entirely overshadowed
by that of Spain, and in this matter the views of Great
Britain were diametrically opposed to those of the
other powers of the alliance. She shared indeed with
France and Austria the strenuous objection to the
emperor Alexander's proposal to march 150,000 Russians into
Piedmont in order to deal with Jacobinism whether in France or
Spain; but she protested equally strenuously against the counter-
proposal of France, which was ultimately adopted, that a French
army should march into Spain to liberate the king from his
contitutional fetters in the name of Europe. George Canning,
carrying on the tradition of Castlereagh, once more protested,
through Wellington, as British plenipotentiary at the congress,
against the whole principle of intervention; and when, in
spite of the British protest, the other powers persisted, the breach
of Great Britain with the continental alliance was proclaimed to
all the world. When, on the 7th of April 1823, the French army
under the duke of Angoulême crossed the Bidasoa, the great
effort of governing Europe through a central committee
of the great powers was at an end. (See Verona, Congress of;
Alexander I.; Londonderry, Robert Stewart, 2nd marquess of;
Canning, George.)

Henceforth, though the treaties survived, and with them
the principle of the concert on which they were based, "Europe"
as a diplomatic conception tends to sink into the back-
ground and to be replaced by the old international
anarchy of the 18th century. To Canning this develop-
ment seemed wholly welcome. He applied to the
rivalry of states the Liberal principle of free competition as the sole
condition of healthy growth. "We are a minister of thirty
years ago," he wrote to Bagot on the eve of the treaty. "I think the
revolutionary scoundrel; but constitutionally hating England, as
Choiseul and Vergennes used to hate us, and so things
are getting back to a wholsome state again. Every nation for itself,
and God for us all." But the essential difference between the
rivalries of the 18th and 19th centuries was in the conception of the "nation." To Canning, as to the diplomats of the
congress of Vienna, "nation" was synonymous with "state,"
and national boundaries were defined by the treaties,
which Canning was as bent on preserving as any of his
reactionary contemporaries. The conception of the
divine right of every nationality to readjust political
frontiers to suit its own ideals was as foreign to him
as to Metternich. Yet this principle of nationality, which was
destined during the 19th century to wreck the political structure
consacrctated at Vienna, and to leave to the succeeding age a host of
unsolved and insoluble problems, found in Canning its earliest
champion in the higher councils of Europe. The recognition
of the independence of the South American republics and of the
belligerent rights of the Greek insurgents were both in the first
instance motived by the particular interests of Great Britain;
but they were none the less hailed as concessions to the principles of
nationality, to which they gave an impetus which was destined
to continue till the face of Europe had been transformed.

Thus in fact constitutes the main significance for Europe of the
War of Greek Independence, which marked the first
rising of the Greeks in the Morea in 1821 till the
signature of the treaty of London on the 7th of May
1832 (see Greek Independence, War of; Turkey: History). Its actual outcome, so far as the political
structure of Europe was concerned, was but to add an insignificant
kingdom to the European states system. But its moral effect
was immense. The sacrosanctity of the status quo had been
violated, and violated with the active aid of three of the powers of
the continental alliance: Russia, France and Great Britain.
Metternich was right when he said that, in principle, there was
no difference between the Greek insurgents and any other
"rebels against legitimate authority," and the Liberals of all
Europe, forced into inactivity by the Austrian police system,
hailed in the Greeks the champions of their own cause.
Philhellenism, beyond its proper enthusiasm, served as a convenient
vehicle for agitation that had little concern with Greek
liberation and for political change were simultaneously at work.
The peace secured by the concert of the powers had given free
play to the mechanical and industrial innovations
that heralded the marvellous economic revolution of the
coming age; wealth increased rapidly, and with it
the influence and the ambition of the middle classes.
The revolution of July 1830, which established the
bourgeois monarchy in France, marked their first triumph. In
countries less economically advanced, e.g. Germany and Italy, the attempt to follow French example ended in failure; but the revolt of the Belgians, for reasons partly economic and partly national, against the domination of the Dutch, resulted in the establishment of the independent kingdom of Belgium—the first actual breach in the territorial settlement of 1815. In Great Britain, the agitation of the disfranchised middle classes, which seemed to threaten a violent revolution, ended in 1832 in the passing of the Reform Bill and their admission to political power. (See FRANCE; GERMANY; ITALY; BELGIUM; ENGLISH HISTORY.)

The easy success of the revolutions in the west of Europe had been due, not to any reluctance of the reactionary powers to interfere on the basis of the old agreements, but to their procrastination with the national revolt in Poland (p. x). In view of this, and of the attitude of Great Britain, they had to recognize the title of Louis Philippe as king of the French, merely stipulating that he should guarantee to maintain the treaties. In spite of the overthrow of the legitimate dynasty in France, and of the partition of the kingdom of the Netherlands, the territorial settlement of Vienna remained, after the revolution of 1830, substantially intact. Outside the limits of the treaties, however, fateful changes were determined, broadly speaking, by the two main questions that dominated international politics between the years 1831 and 1841: (1) the antagonism between the western constitutional powers, France and Great Britain, and the eastern autocratic powers, Russia, Austria, and Prussia; and (2) the crisis in the Eastern question resulting from the revolt of Mehemet Ali, pasha of Egypt, against the Porte.

The strained relations between Great Britain and France, resulting from the French policy of aggression in the Spanish peninsula, which had more than once brought the two powers to the verge of war, had been eased before the fall of the government of Charles X. The peril of a French hegemony over the vast colonial empire of Spain had been forestalled by Canning's recognition of the independence of the South American republics; the intrigues of France in favour of the partisans of Dom Miguel in Portugal had been checked by a political breach, on behalf of the Portuguese Liberals, of the British principle of non-intervention, and finally the chief cause of offence had been removed; in 1827, by the withdrawal of the French army of occupation from Spain. In the Greek question the two powers had acted cordially in concert; and this good understanding even the French conquest of Algiers in 1830, which laid the foundations of the French empire in Africa, had not availed to shatter; for the eyes of the Tory ministry in London were fixed on France as the potential source of revolutionary propaganda, and any over-seas possessions she might acquire were, in Wellington's opinion, so many hostages for her good behaviour given to British sea-power. The results of the July revolution in Paris were accepted by Great Britain so soon as it became clear that Louis Philippe stood for peace and not for revolutionary aggression; the armed intervention of France in favour of the Belgians in August 1831 was stopped by the firm language of Palmerston; the French occupation of Ancona, as a countermove to Austrian aggressions in Italy, was accepted as "an incident of the balance of power"; and the intention of the king of the French to abide by the treaties, which became clearer with the consolidation of his power at home, paved the way for that entente between the two Liberal powers which lasted until 1840.

The cleavage between the fundamental principles of the two groups of autocratic and constitutional powers was not over as soon as it was determined on a general ground: constitutional and national movements, but affected also the position taken up by them during the crisis of the Eastern question evoked by the revolt of Mehemet Ali, pasha of Egypt, a crisis by which between 1839 and 1841 all other diplomatic issues were overshadowed. (See MEHEMET ALI.) During the Greek revolt the efforts of Austria had been directed to preventing a Russian attack upon Turkey; these efforts had failed, and Metternich's worst fears seemed to be realised when the Russo-Turkish campaign of 1828-29 issued in the treaty of Adrianople (September 14, 1829) and the apparently complete vassalage of the sultan to the tsar. But when, in 1832, Sultan Mahmud appealed to Britain in despair to the emperor Nicholas to save him from ruin at the hands of the Egyptian rebels, and, as the result, the treaty of Unkari Skelessi (July 8, 1833) seemed to place definitely in the hands of Russia the keys of the Black Sea, it was left to France and Great Britain to give voice to the protest of Europe. Austria, alarmed by the revolutionary movements of 1830, accepted the fact of Russian preponderance at Constantinople, rather than risk a breach with the autocrat who was now the main pillar of the Holy Alliance. The emperor Nicholas, for his part, was equally prepared to surrender some of his ambitions in the East for the sake of the common cause, the more so since to Russian statesman the maintenance of Turkey in a condition of weakness and dependence now seemed preferable to any attempt to break it up. The result of these dispositions was the convention of Münchenergrätz (September 18, 1833) between Russia, Austria and Prussia, by which the three powers undertook to guarantee the integrity of the Ottoman empire. The following month a secret convention was signed at Berlin between the same powers (October 15), reaffirming the right of the powers to intervene in the internal affairs of a friendly state at the request of its legitimate sovereign, a right with which no third power would be allowed to interfere, such interference to be regarded by the three powers as an act of hostility directed against all of them.

This reconstitution of the "Holy Alliance" on a narrower basis was the work of the emperor Nicholas, whose masterful personality had by this time quite overshadowed the influence of Metternich in the councils of the autocratic powers. There was no formal breach of the Grand Alliance; the "treaties" remained in force; but the French revolution of 1830 had produced a practical disruption which was every day accentuated by the attitude of the British government under the influence of Palmerston. For Palmerston had now become "the firebrand of Europe," openly proclaiming his contempt for international law and equally openly posing as the protector of "oppressed nationalities." "If these two powers (France and England)," wrote the tsar to King Frederick William of Prussia, "have the courage to profess loudly rebellion and the overturn of all stability, we ought to have the right and the courage to support Divine right." This deep cleavage of principles was immediately exhibited in the attitude of the powers towards the troubles in the Spanish empire. In 1833 Ferdinand VII of Spain died, and, under the Pragmatic Sanction, his daughter Isabella succeeded under the regency of Queen Christina; in July, Dom Miguel, the absolutist, pretender to the throne of Portugal, had made himself master of Lisbon. In Spain Don Carlos, Ferdinand's brother, claimed the crown as the legitimate heir, and began the long agony of the Carlist wars; in Portugal the constitutionalists upheld in arms the rights of Queen Maria da Gloria (see SPAIN AND PORTUGAL). Carlists and Miguelists, making common cause, had the moral support of the allies of Münchenergrätz; while France and Great Britain took the side of the Liberals. A formal alliance between the two western powers, proposed by Talleyrand, was indeed refused by Palmerston, who had no wish to commit Great Britain to an irrevocable breach with Austria and Russia, and was suspicious of the ambitions of France in Spain; but ultimately a triple alliance between Great Britain, the Ottoman empire and Austria, object of restoring order in the peninsula—was converted, under pressure from the French government, into the Quadruple Alliance of the 22nd of April 1834.

The entente implied by this formal instrument was, however, more apparent than real. When, in the spring of 1835, Queen Christina applied to the Allies for help against a renewed Carlist rising, Palmerston's suspicions were again aroused by
the somewhat naïve suggestion of Thiers that France should once more intervene as in 1823, a suggestion that was firmly rejected. Palmerston's counter-proposal of an English expedition met with as little favour in Paris. The British government was watching but a "peaceful alliance," as Wellington called it; and the emperor Nicholas, to whom the existence of Louis Philippe as king of the French was at once a sacrilege and a menace, began with a good hope to work for its destruction. The fears roused by the Reform Act of 1832 had been belied by its results; the conservative temper of the British electorate had restored to Great Britain the prestige of a legitimate power; and the pledge of the tsar's renewed friendship and goodwill was the visit of the czar (afterwards the emperor Alexander II.) to the English court in 1839. This was not without its effect on the public sentiment; but the triumph of the tsar's diplomacy was due to fresh complications in the Eastern question, due to the renewed effort of Sultan Mahmoud to crush the hated viceroy of Egypt. These events will be found outlined in the article MEXEMET ALL. Here it will suffice to say that the convention of London of the 13th of July 1840, signed by Great Britain, Austria, Prussia and Russia without calling France into counsel, marked the definite breach of the Anglo-French entente, a breach which was but imperfectly healed by the Straits' Convention signed by all the powers on the 13th of July 1841.

The Straits' Convention was hailed by Count Nesselrode, the Russian foreign secretary, as having re-established "the federative system of the European states on its old basis." This was true, in so far as it created yet another precedent for the concerted action of the European powers, and once more consecrated the right of "Europe" to decide in common on questions of first-rate international importance. But the divergence of interests and principles within the concert were too great to be healed by the settlement of a single issue, however important, and this divergence increased as events moved towards the revolutionary outreaks of 1848. When, in 1846, the independent republic of Cracow was suppressed by agreement of the three autocratic powers, on the ground that it had become a dangerous centre of revolutionary agitation, it was Great Britain and France that protested against an arbitrary infraction of the treaties by the very governments which had laid the greatest stress upon their sanctity. The entente between the two liberal powers had been patched up after the closure of the Egyptian Question; it was cemented by visits of Queen Victoria and the prince consort to the Château d'En (1843 and 1845), and of King Louis Philippe to Windsor (1844); and it survived, in spite of several causes of friction, notably the crisis in Morocco (q.v.), until 1846, when the affair of the Spanish Marriages brought it to a somewhat dramatic conclusion.

The attempt to secure the succession to the Spanish throne for his descendants by pressing on the marriage of the duke of Montpensier with the Infanta Luisa, before that of the "Spanish Marriages," the young queen Isabella had been proved to be fruitful in children, was on the part of Louis Philippe more than a breach of faith with Great Britain (how deeply it was resented may be learnt from Queen Victoria's letters); it was a breach of faith with the revolution that had made him king. Since 1840, indeed, the whole tendency of the king's policy had been to revert to the traditional standpoint of the Bourbons; internally, "resistance" to the growing claims of the democracy; externally, dynastic ambition. But in endeavouring to win the goodwill of the reactionary powers he succeeded only in losing that of the classes of his own people on which his authority was based. In 1847 he joined with the three autocratic powers in supporting the clerical and reactionary Sonderbund in Switzerland, in defiance of the protests of Great Britain and the attitude of the majority of Frenchmen. When, in February 1848, the revolution broke out in Paris, the "bourgeois monarchy" utterly discredited, fell without a struggle (see FRANCE and LOUIS PHILIPPE).

The revolution in Paris was not the cause of the political upheaval which in the year 1848 convulsed Europe from Ireland to the banks of the Danube; it had indeed been preceded by the triumph of Liberalism in Switzerland, by the peaceful revolutions in Nantes and Palermo, and by the grant of a constitution in Piedmont; but flaring up as it were in the revolutionary centre of Europe, it acted as the beacon signal for the simultaneous outbreak of movements which, though long prepared, might but for this have been detached and spasmodic. It was this simultaneity which gave to the revolutions of 1848 their European character and their formidable force. They were the outcome of various, dissimilar and sometimes contradictory impulses: the social, the racial. In France the issue resolved itself into a struggle between the new working-class ideal of Socialism and the bourgeoisie ideal of the great Revolution; in England the Chartist movement presented, in a less degree, the same character; in Germany, in the Austrian empire, in Italy, on the other hand, the dominant motives were constitutional and nationalistic, and of these two the latter became in the end the determining factor. The events of the different revolutions are described (see FRANCE; AUSTRIA; GERMANY; HUNGARY; ITALY). From the point of view of Europe such unity as they possessed was due to their being, so far as Central Europe was concerned, directed against the system of "stability" associated with the name of Metternich. In hatred of this system German, Czech, Magyar, and Italian were united; Kossuth's great speech of the 3rd of March echoed far beyond the frontiers of Hungary; the fall of Metternich (March 13) was a victory, not only for the populace of Vienna, but for all the peoples and races which had worn the Austrian fetters. It was the signal for revolutions in Hungary (the passing of the "March Laws"), in Bohemia, in Prussia (March 15), in Milan; on the 23rd of March, Charles Albert of Sardinia, placing himself at the head of the Italian national movement, declared war against Austria. Against a movement so widespread and apparently inspired by a common purpose the governments were powerless. The collapse of the Austrian administration, of which the inherent rottenness was now revealed, involved that of those reactionary powers which had leaned upon it. One by one they accepted what seemed to be the inevitable; even Pope Pius IX. sent troops to fight under the banner of St Peter for the Italian cause; while in Berlin Frederick William IV., wrapped in the gold and black colours of imperial Germany, posed as the leader of "the glorious German revolution." When, on the 18th of May, the parliament of United Germany was opened at Frankfurt, it seemed as though pan-German dreams were on the threshold of realisation; while in Italy, early in the same month, Lombardy, Modena, Parma and Piacenza declared by plebiscites for incorporation in the north Italian kingdom, Venice following suit on the 4th of June. A profound modification of the European states system seemed inevitable.

That, in the event, the revolutions of 1848 left the territorial settlement of Vienna intact, was due in the main to the marvellous resisting power of the Habsburg monarchy, the strength of which lay in the traditional loyalty of the army and the traditional policy of balancing race against race. The triumph of democracy in Germany was made possible only by the temporary collapse of the Habsburg power, a collapse due to the universality and apparent unanimity of the onslaught upon it. But it was soon clear that the unanimity was more apparent than real. The victory of the democratic forces had been too easy, too seemingly overwhelming; the establishment of the constitutional principle in the main centres of autocracy seemed to make common action against the powers of reaction of secondary importance, and free play was allowed to the racial and national antagonisms that had been present from the first. The battle of German, as well as of Italian, liberty was being fought out on the plains of Lombardy; but the German democrats, whether in Vienna or Frankfurt, hailed the victories of the veteran Radetzky as triumphs of Germanism. In Bohemia the
revolution was wrecked on the rivalry of German and Czech; and when the Hungarians drew the sword against Austria, the imperial government was reinforced by the hatred of the southern Slavs for their Magyar task-masters.

In the wars of national races, the old order began slowly to reappear. So early as the 15th of June 1848 Prince Windischgrätz had restored order in Prague and received the thanks of the Frankfurt parliament; on the 25th of July Radetzky's victory at Custozza set free the imperial army in Italy; on the 4th of September Jellachich, ban of Croatia, invaded Hungary in the name of the united empire; on the 1st of November Windischgrätz incorporated Vienna. The alliance of the army and the Slav races had won the victory over German democracy. The combating of Hungarian nationalism proved a longer and a harder task; but the Austrian victory of Kapola (February 26-27, 1849) encouraged Schwarzenberg to dissolve the rump of the Reichsrath at Kremsier and proclaim a new constitution for the whole empire, including Hungary. The Magyar victories that followed issued in the proclamation, on the 14th of April, of the independence of Hungary. But though the Austrian army had not been strong enough to crush the Hungarian revolt, they had proved at least the vitality of the conservative principle. The emperor Nicholas I. of Russia had watched in disguised silence the weak spirit of concession with which the revolutions had been everywhere met; so long as the sovereigns seemed to forget their divine mission he had held rigorously aloof, and had only broken silence to congratulate Windischgrätz on his capture of Vienna and Schwarzenberg on his reassertion of vigorous principles. Now, however, that Divine Right was in arms against the forces of disorder, he was prepared to listen to the prayer of the emperor Francis Joseph for assistance against the Hungarian rebels. The engagements of 1833 were remembered; and in the brotherly spirit of the Holy Alliance, Hungary was subdued by Russian armies and handed over, without quid pro quo, to her legitimate king.

Görgei's capitulation of Világos (August 14, 1849) cleared the ground for the complete restoration of the system destroyed by the March revolutions of the year before. The refusal of Frederick William IV. of Prussia to accept the imperial crown (April 22, 1849) had already advertised the failure of the constitutional and unionist movement in Germany; and Prussia, her military prestige restored, stood once more face to face with Austria in rivalry for the hegemony of Germany. In the diplomatic contest that followed Prussia was supported in her claim to an independent supremacy in the north were defeated, and the convention of Olmütz (November 29, 1850) restored the status quo of the Confederation as established in 1815.

Within three years of the great upheaval of 1848 the forces of revolution seemed everywhere to have been subdued, the states system of Europe to have been re-established on the basis of the treaties of Vienna. In reality, however, this restoration was only on the surface; the cracks in the structure of the European system had—to use Bismarck's phrase—applied to another occasion—only been "papered over"; and soon ominous rents revealed the fact that the forces that had threatened it with sudden ruin were still at work. One fateful breach in the treaties had, indeed, been accepted as beyond repair; when the dust of the revolutionary turmoil was at length laid a Bonaparte was once more firmly seated on the throne of France. The emperor Nicholas, watching from the calm of Russia, had realized all that the recognition of this fact would involve; he had proposed to set in motion the somewhat rusty machinery of the Grand Alliance, but the other autocratic powers were in no case to support a legitimate crusade, and when Napoleon in 1852 assumed the title of emperor, all Europe recognized his right to do so, even Nicholas being fain to content himself with refusing to treat the "parricide monarch" as his "brother," and to admit his style of "third," Napoleon, which seemed to imply a dynastic claim. Napoleon, indeed, was accepted by the powers, as he was welcomed by the French people; as the "saviour of society" from the newly revealed perils of the social revolution. For new and ominous forces had made their appearance since the revolution of 1848; had established the middle classes in power. The policy of Cuvier and Wheatstone, of a "natural" history of Europe with astonishing rapidity, with its resulting concentration of vast populations in factories and factory cities; and this "proletarian," excluded from any voice in the government, and exposed in accordance with the prevailing economic theories of doctrinaire Liberalism to the horrors of unrestricted competition, had begun to organize itself in a movement, of which the catchword was "the right to work."

The "bourgeoisie" became the red flag of the socialist commune. The reign of Charles X. had been the reditio ad absurdum of the principle of legitimacy; that of Louis Philippe had discredited for ever government based solely on the bourgeoisie; the socialist experiments of 1848 in Paris had collapsed amidst the anarchy and bloodshed of the June days. At this opportune moment Louis Napoleon Bonaparte proclaimed to the French people the "Napoleonic Idea" as conceived by himself. The great Napoleon had been the incarnation of the Revolution, had "sprung armed from the Revolution, like Minerva from the head of Jupiter"; he had ruled because to him the people, by whom the Revolution had been made, had delegated the duty of repressing, protecting and guiding it. Of this idea Louis Napoleon conceived himself to be the heir; and when by a double plebiscite the French nation had established him in supreme power, first as president for life (1852), then as emperor (1852), he was able to claim that he represented the people in a far more immediate sense than could be asserted of the chance majority of any representative assembly.

It was clear that, sooner or later, Napoleon III. would prove a disturbing force in Europe. His title to rule was that he represented France; it followed therefore that he must be hostile to "the treaties," by which the traditional aspirations of France, e.g. for her "natural boundaries" of Rhine, Alps and Pyrenees, were restrained. He was reigned as "emperor of the French"; it followed that he represented that principle of nationality which the treaties ignored. He could not afford—as Metternich had said of Ferdinand of Naples—"to treat his throne as an arm-chair"; and any activity he might display would be almost certainly at the expense of the established order. At the outset, indeed, it was his policy to pose as its custodian. To conciliate the French clericals he supported the pope against the Italian Liberals; but otherwise he proclaimed aloud his devotion to the arts of peace. A period of rapid material expansion succeeded the unrest of the revolutionary years; engineers and men of science were quickly producing a change in all the material conditions of life, greater than could have been effected by any political revolution; especially the face of Europe was gradually being covered with a network of railways, which it was hoped would draw the European nations not only materially but morally closer together. The first universal exhibition, opened under the auspices of the prince consort at London in 1851, was intended to advertise and consecrate the dawn of a new era of international peace and goodwill. The Crystal Palace at Sydenham, once hailed as the "bright Koh-I-nur of the West," remains the dismal monument of a hope so soon to be belied by the hard logic of events. For no period since 1815 has been so occupied with wars and the rumours of war as the twenty years that followed the opening of this great temple of peace.

One question, that of the ultimate destination of the duchies of Schleswig and Holstein, which threatened the tranquillity of the West, was temporarily settled by the conference of London in 1852 (see SCHLESIENG-HOLSTEIN QUESTION). But about the same time anxious watchers noticed on the political horizon in the East a cloud, no bigger than a man's hand, that threatened a serious storm. At first this was no more than a quarrel between Greek and Latin monks about the custody of certain holy places and things in Palestine.
It soon, however, became clear that behind these insignificant combatants loomed the figures of the emperors of Russia and France. The motives that induced Napoleon to take up the cause of the rights of the Latin church in this matter were partly political, partly personal. He resented the tsar’s attitude towards himself; he wished to gain the firm support of the clergy for his throne; he desired to win prestige for himself and his dynasty by reasserting the traditional influence of France in the Ottoman empire. These events that led up to the Crimean War, and those of the war itself, are told elsewhere (see Crimean War). Great Britain had been drawn into the war by her traditional policy of preserving the Ottoman empire as a barrier against the advance of Russia to the Mediterranean and the consequent danger to the British empire in India. It is now generally conceded that, so far as these objects were concerned, the war was a tragic mistake. The hopes that were built on the capacity of Turkey to reform itself were disappointed; the restrictions imposed upon Russia were repudiated at the first opportunity, during the Franco-German War in 1870; and the results of the Russo-Turkish War of 1876 have shown that a far more effective barrier against Russia than the weakened Ottoman empire has been furnished by the young and vigorous national states of the Balkan Peninsula. None less the, treaty of Paris (1856), by which the war was closed, marks an important epoch in the diplomatic history of Europe; and it is impossible to say that the blows spilt in the Crimea was wholly wasted. At the time the main success of the allied powers seemed to be in the thrusting back of Russia from the Danube by the cession of Bessarabia, the extinction of Russian sea-power in the Black Sea, the formal repudiation of the tsar’s claim to a special right of interference in Turkey. But the true significance of the work of the congress of Paris lies in the impetus given by it to the development of an effective international law. The congress of Europe was inaugurated by the solemn admission of the Ottoman empire to an equality of status with the European powers and the declaration of the collective obligations of Europe towards it. The congress, moreover, acted in some sort as the legislative body of Europe; it established the principle of the free navigation of the Danube and of the right of all nations to carry their commerce into the Black Sea; by a declaration, signed by all the powers present, it abolished the practice of granting letters of marque to privateers in war time. The question was then discussed of establishing some sanction by which the rules of international law agreed upon should be enforced upon recalcitrant states; and, though nothing was settled, a few to this effect was entered upon the protocol. The congress of Paris thus set a precedent ‘more hopeful than those of the congresses held earlier in the century’, because the issues were not confused by the supposed necessity for upholding ‘legitimacy’ at all costs; it was a stage in the progress from the ideals of the Grand Alliance to those of the Hague Conference.

The conclusion of the Crimean War left the emperor Napoleon the most influential personage in Europe; and Paris, the seat of the congress, became also the centre of the diplomatic world. Russia had been bled almost to death by the war; Austria was discredited and isolated owing to the dubious part she had played in it; Prussia had not recovered from the humiliation of Olsun; Great Britain was soon plunged into the critical struggle of the Indian Mutiny. The time was obviously opportune for the realisation of some of the aspirations implied in the Napoleonic idea. The opportunity came from the side of Italy. By sending Sardinian troops to fight in a quarrel not their own, alongside the Allies in the Crimea, Cavour had purchased for Piedmont the right to be heard in the councils of power. As a right of the powers to which, at least in the so-called congress to denominate before all Europe the Austrian misrule in Italy. The Italian unionists were at one with Napoleon in desiring to overprint “the treaties”; and the Franco-Italian alliance which, in 1859, drove the Austrians out of Lombardy and established the nucleus of the Italian kingdom was the beginning of a process which, within twelve years, was to change the balance of Europe. It was ominous of the future that it was largely the menace of Prussian intervention that persuaded Napoleon to conclude the armistice of Villafranca (July 11, 1859), which, contrary to his agreement with Victor Emmanuel, left Venice to the Austrians. In spite of the peace of Zürich (November 10), indeed, the union of Italy continued during the succeeding years, and Savoy and Nice were the reward of the French emperor’s compliance (see Italy). France thus once more gained her “natural frontier” of the Alps; the question was whether she would be able to regain another natural frontier on the Rhine. The times were not unpropitious for an enterprise which was undoubtedly one of the main objects of Napoleon’s policy. The European concert had ceased to exist as an effective force; the treaties had been violated with impunity; in Germany, where the tension between the two great powers had not been eased by Prussia’s dubious attitude during the war, there was little prospect of a united opposition to French aggression, and the conditions seemed highly favourable for reviving the traditional policy of exploiting German disunion for the aggrandisement of France. Prussia was arming, but her armaments were directed not against Napoleon but against Austria; and the beginning of the reign of William I, who had become regent in 1858 and king in 1861, pointed to the development of a situation in which the emperor would once again become the arbiter of Germany. On the 20th of March 1862 Prussia signed a commercial treaty with France on a basis that involved the exclusion of Austria from the Zollverein, and replied to the protests of the court of Vienna by recognising the new kingdom of Italy. In September of the same year King William placed the supreme direction of Prussian policy in the hands of Otto von Bismarck, whose views on the exclusion of Austria from Germany were known to all the world.

The outcome of the Polish insurrection of 1863, however, again altered the aspect of things, and in a direction unfavourable to France (see Poland: History). Napoleon had been forced by French public opinion to come forward as the protector of the Poles; but the spectacle of a Bonaparte posing as the champion of the treaties was not impressive; his brave words were not translated into action; and he only succeeded in offending Russia by his protests and alienating Great Britain by his overtures. The proffered intervention of Austria, France and Great Britain was rejected in a note of Prince Gorchakov to Baron Brunnow, the Russian ambassador in London (July 1, 1863); no action followed; and the last effort to put forward the treaties of Vienna as the common law of Europe ended in a fiasco. British ministers, who had been made to look somewhat ridiculous, henceforth began to be charged with a “blind” support of which once more Austria and France were alike discredited and isolated. Prussia which, under Bismarck’s auspices, had sided Russia in suppressing the Poles (convention of February 8, 1863) alone emerged from the crisis with increased prestige. Bismarck, indeed, was too wary to accept the tsar’s suggestion of an offensive alliance and an immediate combined attack on Austria and France; but in the coming struggle for the hegemony of Germany he was least of all neutral.

The final act in this long rivalry began with the opening up of the Schleswig-Holstein question on the death of Frederick VII. of Denmark and the accession of the “protocolizing” Christian IX. (November 15, 1863). The German claim to the Elbe duchies, the Danish claim to at least Schleswig as an integral part of the northern kingdom, were but subordinate issues of questions far more fateful, the development of which once more involved the hopeless entanglement of the idea of the European concert. In the struggle for the possession of the duchies the general sentiment of Germany was on one side, that of Europe on the other. By the protocol of 1852 the duchies had been treated as an integral part of Denmark, and France and Great Britain, as signatory powers, alike protested against the action

Napoleon and Germany.
of Austria and Prussia in asserting the German claim by force of arms. But, as in the case of Poland, protests were not followed by action; Napoleon in the end contented himself with proposing his favourite "Napoleonic idea" of a plebiscite, to discover the will of the provinces concerned as a means for the solution of some of the important issues involved, allowed his martial attitude, under exalted influences, to evaporate in words. Thus Great Britain earned the lasting resentment of Germans, without succeeding in preventing the establishment of German sea-power in the Baltic. For the Prussian war-harbour of Kiel and the Kiel canal were in Bismarck's mind from the outset. Throughout he intended to make the duichies a part of Prussia and to use the whole question as a means for the solution of that of Germany. The Austro-Prussian War of 1866 grew inevitably out of the Dano-German War of 1864; and the treaty of Prague (Aug. 23, 1866), which excluded Austria from Germany and established the North German Confederation under the headship of Prussia, not only absorbed into Prussia the North German states which had sided with Austria, but by the annexation to her of Schleswig and Holstein laid the foundations of German power in the North Sea, and of German rivalry with England in the future.

More immediate were the effects of the campaign of Königgrätz on France. The rapid and overwhelming victory of Prussia overthrew all the calculations of Napoleon, who had looked to intervening as arbiter between exhausted combatants. The sudden menace of the new German power alarmed him, and he sought to secure the Rhine frontier for France, by negotiations with Prussia, in the form of "compensations" at the expense of the South German states. He succeeded only in placing a fresh weapon in Bismarck's hands. The communication of the French outposts to the South German courts was enough to throw them into the arms of Prussia; and treaties of offensive and defensive alliance were signed in August 1866 between Prussia and Württemberg (3rd), Baden (17th), and Bavaria (23rd), by which the king of Prussia was to receive the supreme command of the allied armies in time of war. In vain Napoleon tried to retrieve his damaged prestige by securing compensation elsewhere. His proposal that the grand-duchy of Luxembourg, which had not been included in the new German Confederation, should fall to France by agreement with Prussia was no more successful than his other demands for compensation. Luxembourg was declared a neutral state by the Convention of London in 1867 (see Luxembourg), and the French demand, proposed by Bismarck in The Times at the outset of the war of 1870, only damaged the French emperor's cause in the eyes of Europe.

Meanwhile public feeling in France had become seriously excited by this sudden menace of a hostile power on her eastern frontier, and this excitement was raised to fever heat when it became known that the vacant throne of Spain had been offered to and accepted by a prince of the house of Bourbon. Napoleon's policy has become hopelessly discredited by the successive fiascos in Poland, Mexico and Germany, and even the establishment of a liberal constitution in 1869 could not avail to restore confidence in him. He knew the risk he ran in challenging a conflict with a power whose military efficiency had been so strikingly displayed; but by refusing to do so, in the excited state of public feeling, he would have risked his throne. He reckoned on the traditional jealousy of the South German states for Prussia and their traditional friendship with France; he was assured, too, of the support of Austria, in the event of a victorious opening of the campaign. On the other hand Bismarck was bent on war, which, in accordance with his policy of "blood and iron," he believed to be the sole effective means of binding the heterogeneous elements of Germany into a coherent whole. The device of the "Ems telegrams" (see BISMARCK) was sufficient to end the hesitations of Napoleon by giving an irresistible volume to the cry of the war party in France; and on the 19th of July the French emperor's declaration of war was handed in at Berlin.

The story of the struggle that followed is told elsewhere (see Franco-German War). The hopes that Napoleon had based on the action of the South German courts was belied; and the first crushing German victories (Weissenburg, August 25), and at Magdeburg and Wörth, on November 1, gave the chance of Austrian co-operation but brought down with a crash the imposing façade of the Second Empire. On the 2nd of September Napoleon surrendered, with his army, at Sedan; and two days later the Empire was overthrown and a provisional republican government set up at Paris. On the 19th Paris itself was invested and, after a heroic defence, capitulated on the 30th of January 1871. On the 18th of January, at the house of Versailles, William I., king of Prussia, was proclaimed German emperor. On the 26th of February were signed the preliminaries of peace, by which France agreed to cede to the German empire Alsace (except Belfort and its territory) and German Lorraine, with Metz and Thionville (Diedenhofen), and to pay a war indemnity of five million francs (2,000,000,000) in three years, to be secured by the occupation of French territory. The definitive treaty was signed at Frankfort-on-Main on the 10th of May 1871.

The most important outcome of the events which culminated in the Franco-German War and its result was the establishment of a powerful German empire, which was destined to dominate the continent for years to come, and the expansive ambitions of which remain pregnant with menace for the future. So great an overturn, however, involved other changes in the territorial system, which may be briefly summarized. The most notable of these was the reconstruction of the Austrian monarchy as a result of the war of 1866. By the treaty of Vienna (October 3, 1866) between Austria and Italy, Austria recognized the Italian kingdom and ceded to it the city and territory of Venice, thus surrendering the traditional claim of the Habsburgs to dominion in Italy. This was followed in 1867 by the establishment of the Dual Monarchy in the Habsburg dominions under the auspices of Bismarck's rival, Count Beust,—Francis Joseph being crowned king of Hungary, and a separate constitution being established for Hungary and the Cis-Leithian dominions of the Austrian emperor (see Austria: History). In Italy, meanwhile, the unification of the kingdom had continued after the conclusion of the war of 1859 by the treaty of Zürich. In 1860 Tuscany, Parma and Modena were united to the monarchy of Victor Emmanuel, at the cost of the cession of Nice and Savoy to Napoleon. In May of the same year Garibaldi and his "Reds" landed in Sicily, which he reduced by the end of June; in August he entered the Kingdom, and the capitulation of Francis II. of the Two Sicilies at Gaeta on the 13th of February 1861 ended the Bourbon kingdom in southern Italy. On the 17th of March Victor Emmanuel II. was proclaimed king of United Italy.

This title, as mentioned above, was recognized by Austria in 1866, when Italy was increased by the cession of Venice. Finally, Rome, which had been preserved to the papacy by Napoleon's troops, was on their withdrawal occupied by the Italians on the 20th of September 1870. Thus the temporal power of the popes came to an end; and the unification of Italy was completed (see Italy: History).

Another significant outcome of the collapse of France was the denunciation by Russia of the "Black Sea" clauses of the treaty of Paris of 1856, an action rendered possible by the extirpation between the governments of Berlin and St. Petersburg. In the note addressed to the signatory powers announcing that Russia no longer felt herself bound by the clauses of the treaty limiting her sovereign rights in the Black Sea, Prince Gorchakov wrote: "It would be difficult to affirm that the written law founded on the respect for treaties, as the basis of public right and rule of the relations of states, has preserved the same moral sanction as in former times." The action of Russia was, in fact, a practical illustration of Bismarck's dictum that "resus sic stamibus is involved in all treaties that require performance." (Mer. jil. 280), and that "ultra posse nemo obligatur" holds good in spite of all treaty obligations whatsoever, nor can any treaty guarantee
the discharge of obligations when the private interest of those who lie under them no longer reinforces the text" (ib., ii. 270). Great Britain did her best to counteract a doctrine so subversive of international confidence. For a moment at least a diplomatic breach with Russia seemed inevitable. At Bismarck’s suggestion, however, a conference was held at London to arrange the affair. There was, in the circumstances, no chance of forcing Russia to recede from her position; but in order "to reconcile facts with principles" the conference on the 17th of January 1871 agreed on a formula announcing that "contracting powers can only rid themselves of their treaty engagements by an understanding with their co-signatories." Thus the principle of the European concert was saved. But, for the time at least, it seemed that the triumph of Bismarck’s diplomacy had re-established the simple plan that they should take who have the power and they should keep who can.

Beust was not far wrong when he exclaimed, "Je ne vois plus de l’Europe!" (W. A. P.)

By the Franco-German War of 1870–71 and the creation of the German empire the political condition of Europe was profoundly changed. Germany became for a time the leading power on the continent of Europe, and German statesmanship had to devise means for preventing, until the new edifice was thoroughly consolidated, the formation of a hostile coalition of jealous rivals. The first thing to be done in this direction was to secure the support of Russia and Austria to the new order of things.

With regard to Russia there was little cause for apprehension. She had aided Bismarck to carry out his audacious schemes in the past, and there was no reason to suppose that she would change her policy in the immediate future. The rapprochement dated from the Pollach insurrection of 1863, when the governments of France and England, yielding to popular excitement, made strong diplomatic representations to Russia in favour of the Poles, whereas Bismarck not only refused to join in the diplomatic campaign, but made a convention with the cabinet of St Petersburg by which the Russian and German military authorities on the frontiers should aid each other in suppressing the disturbances. From that time the friendship ripened steadily. The relations between the two powers were not, it is true, always without a cloud. More than once the bold designs of Bismarck caused uneasiness and dissatisfaction in St Petersburg, especially during the Schleswig-Holstein complications of 1864 and the Austro-Prussian conflict of 1866; but the wily statesman of Berlin, partly by argument and partly by dexterously manipulating the mutual trust and affection between the two sovereigns, always succeeded in having his own way without producing a rupture, so that during the Franco-German War of 1870–71 Russia maintained an extremely benevolent neutrality, and prevented Austria and Italy from taking part in the struggle. So benevolent was the neutrality that the emperor William at the end of the campaign felt constrained to write to the tsar that he owed to His Majesty the happy issue of the campaign and would never forget the fact. Having thus helped to create the German empire, Alexander II. was not likely to take an active part in destroying it, and Bismarck could look forward with confidence to a long continuance of the cordial relations between the two courts.

The second part of the German chancellor’s programme, the permanent conciliation of Austria, was not so easily carried out. Austria had been the great sufferer, more perhaps than France, from Bismarck’s aggressive policy. For generations she had resisted strenuously and successfully the efforts of the Hohenzollerns to play the leading part in Germany, and she had always considered her own influence in Germany as essential to the maintenance of her position as a first-class power. By the disastrous campaign of 1866 and the consequent treaty of Prague, Austria had been formally excluded from all direct influence in German affairs. With these events still fresh in his recollection, the emperor Francis Joseph could hardly be expected to support the new empire created by his rival at Austria’s expense, and it was known that on the eve of the Franco-German War he had been negotiating with the French government for a combined attack on Prussia. To an ordinary statesman the task of permanently conciliating such a power might well have seemed hopeless, but Bismarck did not shrink from it, and even before the signature of the treaty of Prague he had prepared the way for attaining his object. With regard to Austria, he had first of all, in the first place, "I had two courses open to me after her defeat, either to destroy her entirely or to respect her integrity and prepare for our future reconciliation when the fire of revenge had died out. I chose the latter course, because the former would have been the greatest possible act of folly. Supposing that Austria had disappeared, consider the consequences." He then described very graphically those probable consequences, and drew the conclusion: "for the sake of our own life Austria must live. I had no hesitation, therefore, and ever since 1866 my constant effort has been to stitch up the great torn texture and to re-establish amicable relations with our ancient associate of the Confederation." For this purpose he tried to soothe Austrian susceptibilities, and suggested confidentially that compensation for the losses of territory, influence and prestige in Italy and Germany might be found in south-eastern Europe, especially by the acquisition of Bosnia and Herzegovina; but so long as his rival at Vienna was minister for foreign affairs in Vienna, and Austria had the prospect of being able to recover her lost position by the assistance of Russia and France, these efforts had no success. It was only when Prince Gorchakov had declined Count Beust’s advances, which took the form of suggesting the abolition of the Black Sea clauses of the treaty of Paris, and when France had been paralysed for some years by her war with Germany, that a rapprochement between the cabinets of Vienna and Berlin became possible. Bismarck lost no time in making advances. From the German headquarters at Versailles he sent a despatch to Vienna suggesting the establishing of more cordial relations between the two countries, and Count Beust replied in an equally amicable tone. The emperor Francis Joseph, finding himself isolated, had evidently accepted the inevitable with his customary resignation, and abandoned his dreams of again playing the leading part in Germany. As a further proof of the change in his disposition and aims he replaced Count Beust by Count Andrássy, who was a personal friend of Bismarck, and who wished, as a Hungarian, to see Austria liberated from her German entanglement, and be consented to pay a visit to Berlin for the purpose of drawing still closer the relations between the two governments.

Bismarck was delighted at this turn of affairs, but he advanced with his usual caution. He gave it to be clearly understood that improvement in his relations with Vienna must not interfere with the long-established friendship with Prussia. The tsar, on hearing privately of the intended meeting, gave a hint to Prince Reuss, the German ambassador, that he expected an invitation, and was invited accordingly. The meeting of the three sovereigns took place at Berlin at the end of August 1872. The three ministers, Prince Bismarck, Prince Gorchakov and Count Andrássy, held daily conferences, on the basis that the chief aim in view should be the maintenance of peace in Europe, and that in all international affairs the three powers should consult with each other and act in concert. As a result of three days’ consultation the Three Emperor’s League was founded, without any formal treaty being signed. In this way the danger of a powerful coalition being formed against the young German empire was averted, for in the event of a conflict with France, Germany could count on at least the benevolent neutrality of Russia and Austria, and from the other powers she had nothing to fear. What were Russia designs Bismarck may have had in forming the league, or "Alliance" as it is often called, must be to some extent a matter of conjecture, but we shall probably not be far wrong in adopting the view of a competent Russian authority, who defines the policy of the German chancellor thus: "To make Austria accept definitively her deposition as a Germanic power, to put
her in perpetual conflict with Russia in the Balkan Peninsula, and to found on that irreconcilable rivalry the hegemony of Germany."

For more than two years there was an outward appearance of extreme cordiality between the three powers. They acted together diplomatise, and on all suitable occasions they allied monarchs exchanged visits and sent each other congratulations and good wishes. There was, however, from the beginning very little genuine confidence between them. Before the breaking up of the conferences at Berlin, Alexander II. and his chancellor had conversations with the French ambassador, in which they not only showed that they had suspicions of future aggressive designs on the part of Germany, but also gave an assurance that so long as France fulfilled her engagements to Germany she had nothing to fear. A few months later, when the emperor William paid his return visit to the tsar in St Petersburgh, a defensive convention was concluded by the two monarchs behind the back of their Austrian ally. Without knowing anything about the existence of this convention, the Austrian ally did not feel comfortable in his new position. In Vienna the old anti-Prussian feeling was still strong. The so-called party of the archdukes and the military resisted the policy of Andrassy, and sought to establish closer relations with Russia, so that German support might be unnecessary, but as Bismarck has himself testified, "Russia did not yet respond. The wound caused by the conduct of Austria during the Crimean War was not yet healed. Andrassy made himself very popular in the court society of St Petersburgh during his visit there with his imperial master, but the traditional suspicion of Austrian policy remained." Altogether, the new league was not a happy family. So long as all the members of it were content to accept the status quo, the latent germs of dissension remained hidden from the outside world, but as soon as the temporary state of political quietude was replaced by a certain amount of activity and initiative, they forced their way to the surface. No one of the three powers regarded the status quo as a satisfactory permanent arrangement. In Berlin much anxiety was caused by the rapid financial and military recovery of France, and voices were heard suggesting that a new campaign and a bigger war indemnity might be necessary before the recuperation was complete. In St Petersburgh there was a determination to take advantage of any good opportunity for recovering the portion of Bessarabia ceded by the treaty of Paris, and thereby removing the last tangible results of the Crimean War. In Vienna there was a desire to obtain in the Balkan Peninsula, in accordance with the suggestion of Bismarck, compensation for the losses in Italy and Germany. Thus each of the members of the league was hatching secret schemes for the future, which can no longer be concealed, and with danger for the rest of Europe lay in the possibility of their reconciling their schemes so far as to admit of an agreement for action in common. Fortunately for the onlookers there were important conflicting interests, and the task of reconciling them was extremely difficult, as the subsequent course of events proved.

The first of the three powers to move was Germany. In February 1875 M. de Radovitz was despatched to St Petersburgh on a secret mission in order to discover whether, in the event of hostilities between Germany and France, Russia would undertake to maintain a neutral attitude as she had done in 1870-1871; in that case Germany might be relied on to co-operate with her in her great designs in the East. Prince Gorchakov did not take the bait with the alacrity that was expected. Having overcome in some measure his distrust of the Austrians, which had delayed for so many occasions the three political visions, he had come to understand that it was not for the interests of his own country to have as neighbour a powerful united Germany instead of a weak confederation of small states, and he now perceived that it would be a grave error of policy to allow Germany to destroy still more to her own advantage the balance of power in Europe by permanently weakening France. No doubt he desired to recover the lost portion of Bessarabia and to raise Russian prestige in the East, but he did not wish to run the risk of exciting a great European war, and he believed that what he desired might be effected without war by the diplomatic skill which had warded off European intervention during the Polish troubles of 1863, and had recovered for Russia her freedom of action in the Black Sea during the Franco-Prussian War of 1870-1871. In reply, therefore, to M. de Radovitz's inquiries and suggestions, he declared that the Russian court fostered no ambitious designs in the East or in the West, and desired only peace and the maintenance of the status quo, with possibly an amelioration in the miserable condition of the Christian subjects of the sultan. This rebuff did not suffice to dispel the gathering storm. The warlike agitation in the German inspired press continued, and the French government became thoroughly alarmed. General Leflo, the French ambassador in St Petersburgh, was instructed to sound the Russian government on the subject. Prince Gorchakov willingly assured him that Russia would do all in her power to incline the Berlin cabinet to moderation and peace, and that the emperor would take advantage of his forthcoming visit to Berlin to influence the emperor William in this sense. A few days later General Leflo received similar assurances from the emperor himself, and about the same time the British government volunteered to work likewise in the cause of peace. Representations were accordingly made by both governments during the tsar's visit to Berlin, and both the emperor William and his chancellor declared that there was no intention of attacking France. The danger of war, which the well-informed German press believed to be "in sight," was thus averted, but the incident sowed the seeds of future troubles, by awakening in Bismarck a bitter personal resentment against his Russian colleague. By certain incisive remarks to those around him, and still more by a circular to the representatives of Russia abroad, dated Berlin and beginning with the words maintenir la paix est assurée, Gorchakov seemed to take to himself the credit of having checkmated Bismarck and saved Europe from a great war. Bismarck resented bitterly this conduct on the part of his old friend, and told him frankly that he would have reason to regret it. In the Russian official world it is generally believed that he took his revenge in the Russo-Turkish War and the congress of Berlin. However this may be, he has himself explained that "the first cause of coldness" was the above incident, "when Gorchakov, aided by Decazes, wanted to play at my expense the part of a saviour of France, to represent me as the enemy of European peace, and to procure for himself a triumphant quo ego to arrest by a word and shatter my dark designs! In any case the incident marks the beginning of a new phase in the relations of the three powers; henceforth the powers are to play a double game; on the one hand to make the empire of Russia, and in controlling the Russo-Austrian rivalry in southeastern Europe, while professing to be impartial, he will lean to the side of Count Andrassy rather than to that of Prince Gorchakov. He is careful, however, not to carry this tendency so far as to produce a rapprochement between Russia and France. The danger of a Franco-Russian alliance hostile to Germany is already appearing on the political horizon, but it is only a little cloud no bigger than a man's hand.

The next move in the aggressive game was made by Austria, with the connivance of Russia. During the summer of 1875 an insurrection of the Christian Slavs in Herzegovina, which received support from the neighbouring principalities of Montenegro and Servia, was fostered by the Austrian authorities and encouraged by the Russian consul on the Adriatic coast. A European concert was formed for the purpose of settling the Thessalonician question by means of an administrative commission. The tsar was determined to see that the Russian repressions and efforts of the powers failed, because the insurgents hoped to obtain complete liberation from Turkish rule; and in the beginning of July, with a view to promoting this solution, Servia and Montenegro declared war against the Porte. Thereupon Russia began to show her hand more openly. The government allowed volunteers to be recruited in Moscow and St Petersburgh, and the Russian general Chernyayef, who had distinguished himself in Central Asia, was appointed to the
command of the Servian army. When the ball had thus been set rolling, the two powers chiefly considered that the time had come for embodying the result of their informal confidential pourparlers in a secret agreement, which is known as the convention of Reichstadt, because it was signed at a meeting of the two emperors in the little Bohemian town of that name. It bore the date of the 8th of July 1876—exactly a week after Servia and Montenegro had declared war—and it contained the following stipulations: (1) That so long as the struggle which had just begun remained undecided, the two sovereigns should refrain from interference, and that in the event of the principalities being defeated, any modification of the territorial or political status quo ante to their detriment should be prevented; (2) that in the event of the principalities proving victorious, and territorial changes taking place, Austria should claim compensation in Bosnia and Herzegovina, and Russia should demand the restitution of the portion of Bessarabia which she had lost by the Crimean War; (3) that in the event of the collapse of the Ottoman empire, the two powers should act together to create autonomous principalities in European Turkey, to unite Thessaly and Crete to Greece, and to proclaim Constantinople a free town. The contracting parties evidently expected that the two principalities would be victorious in their struggle with the Porte, and that the compensations mentioned would be secured without a great European war. Their expectations were disappointed. Montenegro, and a brave spirit against superior forces, before five months had passed Servia was at the mercy of the Turkish army, and Russia had to come to the assistance of her protégé. A Russian ultimatum stopped the advance of the Turks on Belgrade, and an armistice, subsequently transformed into a peace, was signed.

Russia and Austria had now to choose between abandoning their schemes and adopting some other course of action, and unforeseen incidents contributed towards making them select the latter alternative. In June 1876 an attempt at insurrection in Bulgaria had been repressed with savage brutality by the Turks, and the details, as they became known some weeks later, produced much indignation all over Europe. In England the excitement, fanned by the eloquence of Gladstone, became intense, and compelled the Disraeli cabinet to take part, very reluctantly, in a diplomatic campaign, with the object of imposing radical reforms on Turkey. In Russia the excitement and indignation were specially lively, and shortly afterwards what gradually formed the resolution that if the powers would not act collectively and energetically, so as to compel the Porte to yield, he would undertake the work single-handed. This resolution he announced publicly in a speech delivered at Moscow on the 10th of November 1876. The powers did not like the idea of separate Russian action, and in order to prevent it they agreed to hold a conference in Constantinople for the purpose of inducing the Porte to introduce the requisite reforms. The Porte was at that moment under the influence of popular patriotic excitement which made it indisposed to accept orders, or even well-mean advice, from governments more or less hostile to it, and the inconsiderate mode of procedure suggested by General Ignatiev, and adopted by the other delegates, made it still more unconciliatory. At the first plenary sitting of the conference the proceedings were disturbed by the sound of artillery, and the Turkish representative explained that the salute was in honour of the new Ottoman constitution, which was being promulgated by the sultan. The inference suggested was that as Turkey had spontaneously entered on the path of liberal and constitutional reform for all Ottoman subjects, it became superfluous and absurd to talk of small reforms for particular provinces, such as the conference was about to propose. The deliberations continued, but finally the Porte refused to accept what the plenipotentiaries considered an irreducible minimum, and the conference broke up without any practical result. The tsar's Moscow declaration about employing singlehanded the requisite coercive measures now came to be fulfilled.

In order to make a successful aggressive move on Turkey, Russia had first of all to secure her rear and flank by an arrangement with her two allies. In Berlin she encountered no difficulties. Bismarck had no objection to seeing Russia weaken herself in a struggle with Turkey, provided she did not upset the balance of power in south-eastern Europe, and he felt confident that he could prevent by diplomatic means any such catastrophe. He was inclined, therefore, to encourage rather than restrain the bellicose tendencies of St Petersburg. In Vienna the task of coming to a definite arrangement was much more difficult, and it was only after protracted and laborious negotiations that a convention was concluded on the 15th of January 1877, and formally signed three months later. It was a development of the agreement of Reichstadt, modified according to the changes in the situation, but retaining the essential principle that in the event of the territorial status quo being altered, Russia should recover the lost portion of Bessarabia, and Austria should get Bosnia and a part of Herzegovina. Having made these preliminary arrangements, Russia began the campaign simultaneously in Europe and Asia Minor, and after many reverses and enormous sacrifices of blood and treasure, she succeeded in imposing on the Turks the "preliminary peace" of San Stefano (3rd March 1878). That peace was negotiated with very little consideration for the interests of the other powers, and as soon as the terms of it became known in Vienna and London there was an outburst of indignation. In negotiating the treaty General Ignatiev had ignored the wishes of the Porte, and had even according to Count Andrassy, infringing the convention signed at the beginning of the war. However this may be, the peace of San Stefano brought to the surface the latent conflict of interests between the two empires. Russia's aim was to create a big Bulgaria under the influence of St. Petersburg, and to emancipate Servia and Montenegro as far as possible from Austrian influence, whereas Austria objected to the creation of any large Slav state in the Balkan Peninsula, and insisted on maintaining her influence at Belgrade and Danzig (Cetinje). In vain Prince Gorchakov endeavoured to conciliate Austria and to extract from Count Andrassy a clear statement of the terms he would accept. Count Andrassy was in no hurry to extract Russia from her difficulties, and suggested that the whole question should be submitted to a European congress. The suggestion was endorsed by Great Britain, which likewise objected to the San Stefano arrangements, and Bismarck declined to bring any pressure to bear on the Austrians. Berlin Congress.

Deceived in her expectations of active support from her two allies, Russia found herself in an awkward position. From a military point of view it was absolutely necessary for her to come to an arrangement either with Austria or with England, because the communications of her army before Constantinople with its base could be cut by these two powers acting in concert—the land route being dominated by Austria, and the Black Sea route by the British fleet, which was at that time anchored in the Sea of Marmora. As soon, therefore, as the efforts to obtain the support of her two allies against the demands of England had failed, negotiations were opened in London, and on the 30th of May a secret convention was signed by Lord Salisbury and Count Schuvalov. By that agreement the obstacles to the assembling of the congress were removed. The congress met in Berlin on the 13th of June, and after many prolonged sittings and much secret negotiation the treaty of Berlin was signed on the 13th of July. By that treaty the preliminary peace of San Stefano was considerably modified. The big Bulgaria defined by General Ignatiev was divided into three portions, the part between the Danube and the Balkans being transformed into a vassal principality, the part between the Balkans and the Rhodope being made into an autonomous province, called Eastern Rumelia, under a Christian governor named by the sultan with the assent of the Porte, and the remaining part being placed under the direct rule of the Porte. The independence of Montenegro, Servia and Rumania was formally recognized, and each of these principalities received a considerable accession of territory. Rumania, however,
in return for the Dobrudja, which it professed not to desire, was obliged to give back to Russia the portion of Bessarabia ceded after the Crimean War. In Asia Minor Russia agreed to confine her annexations to the districts of Kar, Ardahan and Batum, and to restore to Turkey the remainder of the occupied territory. As a set-off against the large acquisitions of the Slav races, the powers recommended that the sultan should cede to the kingdom of Greece the greater part of Thessaly and Epirus, under the form of a rectification of frontiers. At first the sultan refused to act on this recommendation, but in March 1821 a compromise was effected by which Greece obtained Thessaly without Epirus. Bosnia and Herzegovina were to be occupied and administered by Austria-Hungary, and the Austrian authorities were to have the right of making roads and keeping garrisons in the district of Novi-Bazar, which lies between Servia and Montenegro. In all the provinces of European Turkey for which special arrangements were not made in the treaty, the Porte undertook (Art. 23) to introduce organic statutes similar to that of Crete, adapted to the local conditions. This article, like many of the subordinate stipulations of the treaty, remained a dead letter. We may mention specially Art. 61, in which the Sublime Porte undertook to realize without delay the ameliorations and reforms required in the provinces inhabited by Christians, and to guarantee their safety against the Circassians and Kurds. Equally unavailing proved the scheme of Lord Beaconsfield to secure good administration throughout the whole of Asia Minor by the introduction of reforms under British control, and to prevent the further expansion of Russia in that direction by a defensive alliance with the Porte.

A convention to that effect was duly signed at Constantinople a few days before the meeting of the congress (4th June 1878), but the only part of it which was actually realized was the occupation and administration of Cyprus by the British government. The new frontiers stipulated in the treaty of San Stefano, and subsequently rectified by the treaty of Berlin, are shown in the accompanying sketch-map.

The secret schemes of Russia and Austria, in so far as they were defined in the agreement of Reichstadt and the subsequent Austro-Russian treaty of Vienna, had thus been realised. Russia had recovered the lost portion of Bessarabia, and Austria had practically annexed Bosnia and Herzegovina, though the nominal suzerainty of the sultan over the two provinces was maintained. But Russia was far from satisfied with the results, which seemed to her not at all commensurate with the sacrifices imposed on her by the war, and her dissatisfaction led to a new grouping of the powers. Before the opening of the Berlin congress Bismarck had announced publicly that he would refrain from taking sides with any of the contending parties, and would consider the preliminary announcement was received by the Russians with astonishment and indignation. What they expected was not an impartial arbiter, but a cordial and useful friend in need. In 1871 the emperor William, as we have seen, had spontaneously declared to the tsar that Germany owed to His Majesty the happy issue of the war, and that she would never forget it, and we may add that on that occasion he signed himself "Your ever grateful Friend." Now, in 1878, when the moment had come for paying at least an instalment of this debt, and when Russia was being compelled to make concessions which she described as incompatible with her dignity, Bismarck had nothing better to offer than honest brokerage. The indignation in all classes was intense, and the views commonly held regarding Bismarck's "duplicity" and "treachery" were supposed to receive ample confirmation during the opening of the congress and the following six months. On the 4th of February 1879 Prince Gorchakov wrote to the ambassador in Vienna: "Needless to say, that in our eyes the Three Emperors' Alliance is practically torn in pieces by the conduct of our two allies. At present it remains for us merely to terminate the liquidation of the past, and to seek henceforth support in ourselves alone." The same view of the situation was taken in Berlin and Vienna, though the result was attributed, of course, to different causes, and the danger of serious complications became so great that Bismarck concluded with Andrassy in the following October (1879) a formal defensive alliance, which was avowedly directed against Russia, and which subsequently developed into the Triple Alliance, directed against Russia and France.

The causes of the rupture are variously described by the different parties interested. According to Bismarck the Russian government began a venomous campaign against Germany in the press, and collected, with apparently hostile intentions, enormous masses of troops near the German and Austrian frontiers, whilst the tsar adopted in his correspondence with the emperor William an arrogant and menacing tone which could not be tolerated. On the other hand, the Russians declare that the so-called Press-Campaign was merely the spontaneous public expression of the prevailing disappointment among all classes in Russia, that the military preparations had a purely defensive character, and that the tsar's remarks, which roused Bismarck's ire, did not transgress the limits of friendly exposition such as sovereigns in close friendly relations might naturally employ. Subsequent revelations tend rather to confirm the Russian view. After an exhausting war and without a single powerful ally, Russia was not likely to provoke what was Germany's great war with Germany and Austria. The press attacks were not more violent than those which frequently appear in newspapers which draw their inspiration from the German foreign office, and the accusations about the arrogant attitude and menacing tone of Alexander II. are not at all in harmony with his known character, and are refuted by the documents since published by Dr Busch. The truth seems to be that the self-willed chancellor was actuated by nervous irritation and personal feeling more than by considerations of statecraft. His imperial master was not convinced by his arguments, and showed great reluctance to permit the conclusion of a separate treaty with Austria. Finally, with much searching of heart, he yielded to the importunity of his minister; but in thus committing an unfriendly act towards his old ally, he so softened the blow that the personal good relations between the two sovereigns suffered merely a momentary interruption. Bismarck himself soon recognized that the permanent arrangement of Russia would be a grave mistake of policy, and the very next year (1880), negotiations for a treaty of defensive alliance between the two cabinets were begun. Nor did the accession to the throne of Russia of Alexander III., who had long enjoyed the reputation of being systematically hostile to Germans, produce a rupture, as was expected. Six months after his father's death, the young tsar met the old kaiser at Dantzig
EUROPE

(September 1871), and some progress was made towards a complete renewal of the traditional friendship. Immediately afterwards a further step was taken towards re-establishing the old state of things with regard also to Austria. Of his return to St Petersburg, Alexander III. remembered that he had received some time previously a telegram of congratulation from the emperor himself, and he expressed the hope of soon seeing him again in his home. The emperor invited him toying at Danzig, and describing the emperor William as "that venerable friend with whom we are united in the common bonds of a profound affection." The words foreshadowed a revival of the Three Emperors' League, which actually took place three years later.

The removal of all immediate danger of a Franco-Russian alliance did not prevent Bismarck from strengthening in other ways the diplomatic position of Germany, and the result of his efforts soon became apparent in the alliance of Italy with the two central powers. Even since the Franco-German War of 1870-71, and more especially since the congress of Berlin in 1878, the Italian government had shown itself restless and undecided in its foreign policy. As it was to France that Italy owed her emancipation from Austrian rule, it seemed natural that the two countries should remain allies, but the close cordial relations which must not be.terms may be the course for an old, conservative country which desires merely the maintenance of the status quo, but it does not secure the energetic diplomatic support required by a young enterprising state which wishes to increase its territory and influence. At the congress of Berlin, when several of the powers got territorial acquisitions, Italy received nothing, and the Italians felt it very keenly. In 1875, referring to the meeting at Danzig, and describing the emperor William as "that venerable friend with whom we are united in the common bonds of a profound affection." The words foreshadowed a revival of the Three Emperors' League, which actually took place three years later.

The removal of all immediate danger of a Franco-Russian alliance did not prevent Bismarck from strengthening in other ways the diplomatic position of Germany, and the result of his efforts soon became apparent in the alliance of Italy with the two central powers. Even since the Franco-German War of 1870-71, and more especially since the congress of Berlin in 1878, the Italian government had shown itself restless and undecided in its foreign policy. As it was to France that Italy owed her emancipation from Austrian rule, it seemed natural that the two countries should remain allies, but the close cordial relations which must not be.terms may be the course for an old, conservative country which desires merely the maintenance of the status quo, but it does not secure the energetic diplomatic support required by a young enterprising state which wishes to increase its territory and influence. At the congress of Berlin, when several of the powers got territorial acquisitions, Italy received nothing, and the Italians felt it very keenly. In 1875, referring to the meeting at Danzig, and describing the emperor William as "that venerable friend with whom we are united in the common bonds of a profound affection." The words foreshadowed a revival of the Three Emperors' League, which actually took place three years later.

The removal of all immediate danger of a Franco-Russian alliance did not prevent Bismarck from strengthening in other ways the diplomatic position of Germany, and the result of his efforts soon became apparent in the alliance of Italy with the two central powers. which the Italians had marked out for themselves as necessary for the defence and colonial expansion of the kingdom had the effect which Gambetta had foreseen—it made Italy, for a time at least, the incorrigible enemy of France. Whilst the French were giving free expression to their patriotic sentiments by the exultation of their victorious generals, Gambetta himself, in defiance of what he had said to Cialdini, was congratulating Jules Ferry on having restored France to her place among the nations, the Italians were trying to smother their indignation and to discover some means of retrieving what they had lost. The only remedy seemed to be to secure foreign alliances, and there was now no hesitation as to where they should be sought. Simple people in Italy imagined that if an alliance had been concluded sooner with Germany and Austria, these two powers would have precluded the possibility of the fall of few of the principal allies of France and the safeguarding of the sacred interests of Italy. This idea was entirely erroneous, because Austria had little or no interest in the Tunisian Question, and Bismarck was not at all sorry to see France embark on an enterprise which distracted her attention from Alsace-Lorraine and removed all danger of a Franco-Italian alliance. The illusion, however, had a powerful influence on Italian public opinion. The government was now urged to conclude without further delay an alliance with the central powers, and the recommendation was not unwelcome to the king, because most of the Italian Gallophiles had anti-dynastic and republican tendencies, and he was naturally disposed to draw nearer to governments which proclaimed themselves the defenders of monarchical institutions and the opponents of revolutionary agitation. After protracted negotiations, in which Italy tried in vain to secure protection for her own separate interests in the Mediterranean, defensive treaties of alliance were concluded with the cabinets of Vienna and Berlin in May 1882. Though the Italian statesmen did not secure by these treaties all they wanted, they felt that the kingdom was protected against any aggressive designs which might be entertained by France or the Vatican, and when the treaties were renewed in 1887 they succeeded in getting somewhat more favourable conditions.

By the creation of this Triple Alliance, which still subsists, the diplomatic position of Germany was greatly strengthened, but Bismarck was still haunted by the apprehension of a Franco-Russian alliance, and he made repeated attempts to renew the old cordial relations with the court of St Petersburg. He was bold enough to hope that, notwithstanding the Austro-German treaty of October 1879, avowedly directed against Russia, and the new Triple Alliance, by which the Austro-German Alliance was strengthened, he might reconcile the Three Emperors' League in such a form as to ensure, even more effectually than he had done on the former occasion, the preponderance of Germany in the arrangement. With this object he threw out a hint to the Russian ambassador, M. Sabourin, in the summer of 1883, that the evil results of the congress of Berlin might be counteracted by a formal agreement between the three emperors. The suggestion was transmitted privately by M. Sabourin to the Czar, and was favourably received. Alexander III. was dissatisfied by the continuance of the nihilist agitation, and was not averse from drawing closer to the conservative powers; and as he desired tranquillity for some time in the Balkan Peninsula, he was glad to have security that his rival would do nothing in that part of the world without a previous understanding. M. de Giere, who had now succeeded Prince Gorchakov in the direction of foreign affairs, was accordingly despatched to Friedrichsholz to discuss the subject with Bismarck. The practical result of the meeting was that negotiations between the two governments were begun, and on the 21st of March 1884 a formal document was signed in Berlin. About six months later, in the month of September, the three emperors met at Skiernevski and ratified the agreements. Thus, without any modification of the Triple Alliance, which was directed against Russia, the old Three Emperors' League, which included Russia, was preserved. Germany and Austria, being members of both, were doubly protected; for in the event of being attacked they could count on at least the benevolent neutrality of both Russia and Italy. France was thereby completely isolated.

In drawing up the secret treaty of Skiernevski, which may be regarded as the chef-d'œuvre of Bismarckian diplomacy, the Czar's chancellor's chief aims evidently were to paralyse Russia by Yokking her to Germany and Austria, to isolate her, and to realize his old scheme of holding the balance between Russia and Austria in the Balkan Peninsula. With a view to attaining the first two objects it was stipulated that if any one of the three powers were forced to make war on a fourth power, the two other contracting parties should observe a benevolent neutrality towards their ally. If we may believe a well-informed Russian authority, Bismarck wished it to be understood that in the event of Russia being forced to make war on Germany and Austria, the stipulation about benevolent neutrality should still hold good, but Alexander III. objected, on the ground that he could not remain a passive spectator of a duel in which France would be confronted by two antagonists. In his third object Bismarck was successful, for it was expressly laid down that in all cases of a disagreement between two of the parties in the affairs of the Balkan Peninsula, the third power should decide between them. This meant, of course, that in all discussions between Russia and Austria, the two great rivals in the Eastern Question, Bismarck should always have a casting vote. In return for this, Russia obtained two small concessions: firstly, that Germany and Austria should seek to restrain the sultan from permitting the passage of the Dardanelles to an English fleet, as he had done in 1878, when the Russian army was before Constantinople; and, secondly, that they should not oppose the union of Bulgaria and Eastern Rumelia, if it was accomplished by the force of things and within the limits traced by the congress of Berlin.

This new form of the Three Emperors' League had all the organic defects of its predecessor, and was destined to be still more shortlived. The claims of Russia and Austria might be reconcilable in theory, but in practice they were sure to conflict; and however much Bismarck might try to play the part of an honest broker, he was certain to be suspected of opposing Russia and favouring Austria. It was therefore only during a period of political stagnation in south-eastern Europe that the arrangement could work smoothly. The political stagnation did not last long. Prince Alexander of Bulgaria had for some time been fretting under the high-handed interference of the Russian agents in the principality, and had begun to oppose systematically what the Russians considered their legitimate influence. Relations between Sofia and St Petersburg had consequently become strained, when a crisis was suddenly brought about by the revolution of Philipopolis in September 1885. The conspirators arrested and expelled the governor-general, who had been appointed by the sultan with the consent of the powers, and at the same time proclaimed the union of the autonomous province of Eastern Rumelia with the principality of Bulgaria, in defiance of the stipulations of the treaty of Berlin. The revolution had been effected with the connivance and approval of the regularly accredited Russian agents in Philipopolis, but it had not received the sanction of the Russian government, and was resented as a new act of insubordination on the part of Prince Alexander. When he arrived in Philipopolis and accepted the declaration of union, the cabinet of St Petersburg protested against any such infractions of the Berlin treaty, and the Porte prepared to send an army into the province. It was restrained from taking this step by the ambassadors in Constantinople, so that an armed conflict between Turks and Bulgarians was prevented; but no sooner had the Bulgarians been relieved from this danger on their eastern frontier, than they were attacked from the west by the Servians, who were determined to get ample compensation for any advantage which the Bulgarians might obtain. The Bulgarian army defeated the Servians at Slivnitsa (November 19-20, 1885), and was marching on Belgrade when its advance was stopped and an armistice arranged by the energetic intervention of the Austrian government. Following the example of the Servians, the Greeks were preparing.
to exact territorial compensation likewise; but as their mobilization was a slow process, the powers had time to restrain them from entering upon active hostilities, first by an ultimatum (April 26, 1886), and afterwards by a blockade of their ports (May 1886). By that time the international situation, and the growing unsteadiness of the positions of the powers, had made the policy of a new war between Bulgaria and Servia had been signed at Bucharest (March 3); and with regard to Eastern Rumelia a compromise had been effected by which the formal union with the principality was rejected, and the prince was appointed governor-general of the province for a term of five years. This was in reality union in disguise.

The diplomatic solution of the problem averted the danger of a European war, but it left a great deal of dissatisfaction, which was the reason why the new war that had put Alexander escaped punishment for his insubordination to Russia, but he and the anti-Russian party among the Bulgarians had obtained a decided success. This could not well be tolerated. Before six months had passed (August 21, 1886) Prince Alexander was kidnapped by conspirators in his palace at Sofia and conveyed secretly to Russian Besarabia. As soon as the incident was reported to the tsar, the prince was released, and he at once returned to Sofia, where a counter-revolution had been effectively in his favour; but he considered his position untenable, and formally abdicated. A fortnight after his departure General Kaulbars arrived from St Petersburg with instructions from the tsar to restore order in accordance with Russian interests. In St Petersburg it was supposed that the Bulgarian people were still devoted to Russia, and that they were ready to rise against and expel the politicians of the Nationalist party led by Stam-bolov. General Kaulbars accordingly made a tour in the country and delivered speeches to the assembled multitudes, but Stambolov's political organization counteracted all his efforts, and on the 20th of November he left Bulgaria and took the Russian consul with him. Stambolov maintained his position, suppressed energetically several insurrectionary movements, and succeeded in getting Prince Ferdinand of Coburg elected prince (July 7, 1887), in spite of the opposition of Russia, who put forward as candidate a Russian subject, Prince Nicholas of Mingrelia. Prince Ferdinand was not officially recognized by the sultan and the powers, but he continued to reign under the direction of Stambolov, and the Russian government, passively accepting the accomplished facts, awaited patiently a more convenient moment for action.

These events in the Balkan Peninsula necessarily affected the mutual relations of the powers composing the Three Emperors’ League. France, Austria and secretly encouraging the opposition to Russian influence. This revived the hatred against him which had been created by his pro-Austrian leanings after the Russo-Turkish War. The feeling was assiduously fomented by the Russian press, especially by M. Katkoff, the editor of the Moscow Gazette, who exercised great influence on public opinion and had personal relations with Alexander III. On the 4th of July 1886, three weeks before the kidnapping of Prince Alexander, he had begun a regular journalistic campaign against Germany, and advocated strongly a new orientation of Russian policy. M. de Giers, minister of foreign affairs, was openly attacked as a partisan of the German alliance, and his “pilgrimages to Friedrichsruh and Berlin” were compared to the humiliating journeys of the old Russian grand-princes to the Golden Horde in the time of the Tatar domination. The moment had come, it was said, for Russia to emancipate herself from German diplomatic thraldom, and for this purpose a rapprochement with France was suggested. The idea was well received by the public, and it seemed to be not unpalatable to the tsar, for the Moscow Gazette allowed to continue its attacks on M. de Giers’s policy of maintaining the German alliance. In Berlin such significant facts could not fail to be noticed with uneasiness, because one of the positive aims of the new policy had always been to prevent a Russo-French entente cordiale. The German press were instructed to refute the arguments of their Russian colleagues, and to prove that if Russia had really lost her influence in the Balkan Peninsula, the fact was due to the blunders of her own diplomacy. The controversy did not produce at once a serious estrangement between the two cabinets, but it marked the beginning of a period of vacilation on the part of Alexander III. When the treaty of Skierski was signed in October 1887, not only had the Three Emperors’ League, but he consented to make, without the cognizance of Austria, a secret treaty of alliance with Germany for three years. Not satisfied with this guarantee against the danger of a Franco-Russian alliance, Bismarck caused attacks to be made in the press on Russian credit, which was rapidly gaining a footing on the Paris bourse, and he inappropriately showed his hand by prohibiting the Reichsbank from accepting Russian securities as guarantees. From that moment the tsar’s attitude changed. All his dormant suspicions of German policy revived. When he passed through Berlin in November 1887, Bismarck had a long audience, in which he defended himself with his customary ability, but Alexander remained unmoved in his conviction that the German government had systematically opposed Russian interests, and had paralysed Russian action in the Balkan Peninsula for the benefit of Austria; and he failed to understand the ingenuous theory put forward by the German chancellor, that two powers might have a severe economic struggle without affecting their political relations. Bismarck had to recognize that, for the moment at least, the Three Emperors’ League, which had served his purposes so well, could not be resuscitated, but he had still a certain security against the hostility of Russia in the secret treaty. Soon, however, this link was also to be broken. When the treaty expired in 1890 it was not renewed. By that time Bismarck had been dismissed, and he subsequently reproached his successor, Count Caprivi, with not having renewed it, but in reality Count Caprivi was not to blame. Alexander III. was determined not to renew the alliance, and was already gravitating slowly towards an understanding with France. No treaty or formal defensive engagement of any kind existed between Russia and France, but it was already tolerably certain that in the event of a great war the two nations would not be found fighting on the same side, and the military authorities in both countries felt that if no arrangements were made beforehand for concerted action,—such arrangements having been long ago completed by the powers composing the Triple Alliance,—they would begin the campaigning at a great disadvantage. This was perfectly understood by both governments; and after some hesitation on both sides, Generals Vannovski and Obruchev, on the one side, and Generals Saussier, Miribel and Boisdeffre on the other, were permitted to discuss plans of co-operation. At the same time a large quantity of Lebel rifles were manufactured in France for the Russian army, and the secret of making smokeless powder was communicated to the Russian military authorities. The French government wished to go further and conclude a defensive alliance, but the tsar was reluctant to bind himself with a government which had so little stability, and which might be induced to provoke a war with Germany by the prospect of Russian support. Even the military convention was not formally ratified until 1894. The enthusiastic partisans of the alliance flattered themselves that the tsar’s reluctance had been overcome, when he received very graciously Admiral Gervais and his officers during the visit of the French fleet to Cronstadt in the summer of 1891, but their joy was premature. The formal rapprochement between the two governments was much slower than the unofficial rapprochement between the two nations. More than two years passed before the Cronstadt visit was returned by the Russian
fleet, under Admiral Avelan. The enthusiastic oaths which the admiral and his subordinates received in Toulon and Paris (October 1805) showed how eager and anxious the French people were for an alliance with Russia, but the Russian government was in no hurry to gratify their wishes. Of the official action all we know with certainty is, that immediately after the Cression visit a military commission was sent to Paris and the subscription of 200,000,000 rubles was signed; that during the special mission of General Beissdeffere to St Petersburg in 1802 negotiations took place about a military convention; that in 1804 the military convention was ratified; that in the summer of 1805 M. Ribot, when prime minister, first spoke publicly of an alliance; and that during the visit of the president of the French Republic to St. Petersburg, in August 1807, France and Russia were referred to as allies in the complimentary speeches of the tsar and of M. Félix Faure. Though we are still in the dark as to the precise terms of the arrangement, there is no doubt that close friendly relations were established between the two powers, and that in all important international affairs they sought to act in accord with each other. It is equally certain that for some years Russia was the predominant partner, and that, in accordance with the pacific tendencies of the tsar, she systematically exercised a restraining influence on France.

The great expectations excited amongst the French people by the entente cordiale were consequently not realised, and there appeared gradually premonitory symptoms of a reaction in public opinion, but the alliance between the two governments was maintained, and though the Triple Alliance was weakened by the internal troubles of Austria-Hungary and by a tendency on the part of Italy to gravitate towards France, the grouping of the great powers was not radically changed till the Russo-Japanese War of 1904-5. By that war the balance of power in Europe was seriously disturbed. Russia inadvertently provoked a struggle with Japan which made such a drain on her energies and material resources that her political influence in Europe necessarily suffered a partial eclipse. Thus the Triple Alliance outweighed its rival, and there was a danger of the German emperor's taking advantage of the situation to secure for himself a diplomatic predominance in Europe. France at once perceived that there was a grave danger for herself, and naturally looked about for some diplomatic support to replace that of Russia, which had lost much of its value. From her uncomfortable isolation there were only two possible exits—a rapprochement with Germany or a rapprochement with England. Both of these demanded sacrifices. The former required a formal abandonment of all ideas of recovering Alsace and Lorraine; the latter a formal recognition of British predominance in Egypt. Under the influence of M. Delcassé the French government chose what seemed the lesser of two evils, and concluded with the English foreign office in April 1904 a general agreement, of which the most important stipulation was that France should leave England a free hand in Egypt, and that England in return should allow France, within certain limits, a free hand in Morocco. On that basis was effected a rapprochement between the two governments which soon developed into an entente cordiale between the two nations. The efforts of the German emperor to undermine the entente by insisting on the convolution of a conference to consider the Moroccan question caused M. Delcassé to resign, and produced considerable anxiety throughout Europe, but the desired result was not attained. On the contrary, the conference in question, which met at Algeciras in January 1906, ended in strengthening the entente and in accentuating the partial isolation of Germany.

The grouping of the great continental states into two opposite blocs of hostile camps harked back to preserve the balance of power and the possession of Europe. Through the war and its outcome the centrifugal tendencies of conflict which arose from time to time up to the end of the 19th century were localized. Some of the principal questions involved may be more particularly mentioned.

The Armenian Question was brought prominently before Europe by the Russo-Turkish War of 1877-78. In the treaties of San Stefano and Berlin the Sublime Porte undertook "to carry out without delay the ameliorations and reforms required by local needs in the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and the Kurds." This stipulation remained a dead letter, and the relations between the Armenians and the Mussulmans became worse than before, because the protection of the powers encouraged in the oppressed nationality far-reaching political aspirations, and as a result the idea grew that the intervention of the powers was dangerous for the integrity and independence of his empire. For some fifteen years the Armenians continued to hope for the efficacious intervention of their protectors, but when their patience became exhausted and the question seemed in danger of being forgotten, they determined to bring it again to the front. Some of them confined themselves to agitating abroad, especially in England, in favour of the cause, whilst others made preparations for exciting an insurrectionary movement in Constantinople and Asia Minor. These latter knew very well that an insurrection could be suppressed by the Turkish government without much difficulty, but they hoped that the savage measures of repression which the Turks were sure to employ might lead to the active intervention of Europe and ensure their liberation from Turkish rule, as the famous 'atrocities of 1876 had led to the political emancipation of Bulgaria. In the spring of 1908-09-the atrocities took place in the form of wholesale massacres in Constantinople and various towns of Asia Minor. The sultan was subjected to diplomatic pressure and threatened with more efficient means of coercion. In the diplomatic campaign England took the lead, and was warmly supported by Italy, but Germany, Austria and France showed themselves lukewarm, not to say indifferent, and Russia, departing from her traditional policy of protecting the Christians of Turkey, vetoed the employment of force for an end to the massacres from the sultan. In these circumstances the Porte naturally confined itself to making a few reforms on paper, which were never carried out. Thus the last state of the Armenians was worse than the first, but the so-called European concert was maintained, and the danger of a great European war was averted.

The next attempt to raise the Eastern Question was made by the Greeks. In 1896 a semi-secret society called the Ethniké Hstiria began a Panhellenic agitation, and took advantage of one of the periodic insurrections in Crete to further its projects. In February 1897 the Cretan revolutionary committee proclaimed the annexation of the island to the Hellenic kingdom, and a contingent of Greek regular troops landed near Canea under the command of Colonel Vassos to take possession of the island in the name of King George. The powers, objecting to this arbitrary proceeding, immediately occupied Canea with a mixed force from the ships of war which were there at the time, and summoned the Greek government to withdraw its troops. The summons was disregarded, and the whole of the Greek army was mobilized on the frontier of Thessaly and Epirus. In consequence of a raid into Turkish territory the Porte declared war on the 17th of April, and the short campaign ended in the defeat of the Greeks. The powers intervened to put an end to the hostilities, and after prolonged negotiations a peace was concluded by which Greece had to consent to a formal renunciation of frontier and to pay a war indemnity of 4,000,000. Thus a second time the European concert acted effectually in the interests of peace, but it did not stand the strain of the subsequent efforts to solve the Cretan Question. Finding the Turks less conciliatory after their military success, and being anxious to remain in cordial relations with the Porte, Germany withdrew from further co-operation with the powers, and Austria followed her example. They did not, however, apply for an effectual solution by the appointment of Prince George, second son of the king of Greece, as high commissioner and governor-general of the island. (See CRETE.)

The conflicting desires of several of the powers to obtain colonial possessions in various parts of the world, and to forestall their competitors in the act of taking possession, were bound to introduce complications in which England, as the greatest
of colonial powers, would generally be involved; and as the unappropriated portions of the earth's surface at the beginning of the period under discussion were to be found chiefly in Africa, it was in the Dark Continent that the conflicts of interests mostly took place. England's chief competitors were France and Germany. She continued her policy, except in the south of the continent, where the conditions of soil and climate were favourable to European colonists, had been purely commercial. She had refrained from annexation of territory, as involving too much expenditure and responsibility, and confined her protection to the trading stations on the coast. When France came into the field this policy had to be abandoned. The policy of France was also commercial in a certain sense, but the methods she adopted were very different. She endeavoured to bring under her authority, by annexation or the establishment of protectorates, the largest possible extent of territory, in order to increase her trade by a system of differential tariffs; she encroached on the hinterland of British settlements, and endeavoured to direct artificially the native inland trade towards her own ports. A glance at the map of the African West Coast will suffice to show the success with which this policy was carried out. When the British government awoke to the danger it could do nothing on the Upper Volta, and Herero countries by likewise annexing territory. The result is shown in the article AFRICA: § 5. In her dealings with France about the partition of Africa, England was generally conciliatory, but she was always inoffensive in guarding carefully the two entrances to the Mediterranean. There was, therefore, a permanent danger of conflict in Egypt and Morocco. When England in 1881 considered it necessary to suppress the Arabi insurrection, she invited France to co-operate, but the French government declined, and left the work to be done by England alone. England had no intention of occupying the country permanently, but she had to take precautions against the danger of French occupation after her withdrawal, and these precautions were embodied in an Anglo-Turkish convention signed at Constantinople in May 1887. France prevented the ratification of the convention by the sultan, with the result that the British occupation has been indefinitely prolonged. She still clung persistently, however, to the hope of obtaining a predominant position in the valley of the Nile, and she tried to effect her purpose by gaining a firm foothold on the upper course of the river. The effort which she made in 1886 to attain this end, by simultaneously despatching the Marchand mission from her Congo possessions and inviting the emperor Menelek of Abyssinia to send a force from the east to join hands with Major Marchand at Fashoda, was defeated by the refusal of the Khedive and the British occupation of Khartoum. For a few days the two nations seemed on the brink of war, but the French government, receiving no encouragement from St Petersburg, consented to withdraw the Marchand mission, and a convention was signed defining the respective spheres of influence of the two countries.

In Morocco the rivalry between the two powers was not acute but not less persistent and troublesome. France aspired to incorporate the sultanate with her north African possessions, whilst England had commercial interests to defend and was firmly resolved to prevent France from getting unfettered possession of the southern coast of the Straits of Gibraltar. As in Egypt, so in Morocco the dangers of conflict were averted, in 1904, by a general agreement, which enabled France to carry out in Morocco, as far as England was concerned, her policy of pacific penetration, but debarring her from erecting fortifications in the vicinity of the straits. Germany thereupon strongly opposed French claims in Morocco, but after a period of great tension, and the holding of an ineffectual conference at Algiers in 1906, an understanding was come to in 1909 (see MOROCCO: History).

With Germany likewise, from 1880 onwards, England had some diplomatic difficulties regarding the partition of Africa, but they never reached a very acute phase, and were ultimately settled by mutual concessions. By the arrangement of 1890, in which several of the outstanding questions were solved, Heligoland was ceded to Germany in return for concessions in East Africa. A conflict of interests in the southern Pacific was amicably arranged by the Anglo-German convention of April 1886, in which a line of demarcation was drawn between the respective spheres of influence in the islands to the north and east of the New Hebrides. A similar accord, between the convention of 1899, in virtue of which Germany gained possession of Samoa and renounced in favour of England all pretensions to the Tonga Archipelago.

In Asia the tendencies of the European powers to territorial expansion, and their desire to secure new markets for their trade and industry, have affected from time to time their mutual relations. More than once England and Russia have had disputes about the limits of their respective spheres of influence in central Asia, but the causes of friction have steadily diminished as the work of frontier delimitation has advanced. The important agreement of 1872-1873 was supplemented by the protocol of the 2nd of July 1887 and the Pami delimitation of 1895, so that the Russo-Afghan frontier, which is the dividing line between the Russian and British spheres of influence, has now been carried right up to the frontier of the Chinese empire. The delimitation of the English and French spheres of influence in Asia has also progressed. In 1883 France endeavoured to get a Treaty with China, but Russia, after seizing the tari of Tirucham and the Shan States as far east as the Mekong. Thereupon French pushed her Indo-Chinese frontier westwards, and in 1893 made an attack on the kingdom of Siam, which very nearly brought about a conflict with England. After prolonged negotiations an arrangement was reached and embodied in a formal treaty (January 1896), which clearly foresees a future partition between the two powers, but guarantees the independence of the central portion of the kingdom, the valley of the Menam, as a buffer-state. Further north, in eastern China, the aggressive tendencies and mutual rivalries of the European powers have produced a problem of a much more complicated kind. Firstly Germany, then Russia, next England, and finally France took portions of Chinese territory, under the thin disguise of long leases. They thereby excited in the Chinese population and government an intense anti-foreign feeling, which produced the Boxer movement and culminated in the attack on the foreign legations at Pekin in the summer of 1900. (See CHINA: History.)

In 1899-1901 the relations of the European powers were disturbed by the Boer War in South Africa. In nearly every country of Europe popular feeling was much excited against England, and in certain influential quarters the idea was entertained of utilizing this feeling for the formation of a coalition against the British empire; but in view of the decided attitude assumed by the British government, and the loyal enthusiasm displayed by the colonies, no foreign government ventured to take the initiative of intervention, and it came gradually to be recognized that no European state had any tangible interest in prolonging the independence and maladministration of the Boer republics.

One permanent factor in the history of Europe after the war of 1870-71 was the constant increase of armaments by all the great powers, and the proportionate increase of taxation. The fact made such an impression on the young emperor of Russia, Nicholas II., that he invited the powers to consider whether the further increase of the burdens thereby imposed on the nations might not be arrested by mutual agreement; and a conference for this purpose was convened at the Hague (May 18- July 20, 1899), but the desirable object in view was not attained. (See ARBITRATION, INTERNATIONAL.)

Though neither the first Hague Conference nor the second, which met in 1907, did much to fulfil the expectations of those who hoped for the establishment of a system which should guarantee the world against the disasters of war, they undoubtedly tended to create a strong public opinion in favour of peaceful methods in the solution of international problems which has not been without its effect. Any attempt to organize the concert of the powers must always
fail, as it failed in the early part of the 19th century, so long as the spirit of national and racial rivalry is stronger than the consciousness of common interests; and the early years of the 20th century showed no diminution, but rather an accentuation of this rivalry. The court of arbitration established at the Hague early in 1901 may deal effectively with questions as to which both parties desire a modus vivendi, and the pacific efforts of King Edward VII., which did so much to prevent misunderstandings likely to lead to war, resulted from 1903 onwards in a series of arbitration treaties between Great Britain and other powers which guaranteed the Hague court active activity in such matters. But more perilous issues, involving deep-seated antagonisms, have continued to be dealt with by the methods of the old diplomacy backed by the armed force of the powers. How far the final solution of such problems has been helped or hindered by the general reluctance to draw the sword must for some time to come remain an open question. Certainly, during the early years of the 20th century, many causes of difference which a hundred years earlier would assuredly have led to war, were settled, or at least shelved, by diplomacy. Of these the questions of Crete, of Armenia, and of contested claims in Africa have already been mentioned. Other questions of general interest which might have led to war, but which found a peaceful solution, were those of the separation of Norway and Sweden, and the rivalry of the powers in the northern seas. In October 1905 Sweden formally recognized the separate existence of Norway (see NORWAY: History and Swedes and Norwegians). On the other hand, the British in their "Declarations"; the one, signed by the four Baltic littoral powers, recognized "in principle" the maintenance of the territorial status quo in that sea; the other—to which Great Britain, France, Germany, Denmark, Sweden and Holland were the parties—sanctioned a similar principle in regard to the North Sea. These were followed, in June of the same year, by two agreements intended to apply the same principles to the southern European waters, signed by France and Spain and by the British and Spanish respectively. Another agreement, that signed between Russia and Great Britain in 1907 for the delimitation of their spheres of influence in Persia and the northern borders of the Indian empire, though having no direct relation to European affairs, exercised considerable influence upon them by helping to restore the international prestige of Russia, damaged by the disasters of the war in Japan and the internal disturbances that followed. The new cordial understandings between the British and Russia was cemented by the meeting of King Edward VII. and the emperor Nicholas II. at Reval in June 1908.

More perilous to European peace, however, than any of these issues was the perennial unrest in Macedonia, which threatened sooner or later to open up the whole Eastern Question once more in its acutest form. The situation was due to the internecine struggle of the rival Balkan races—Greeks, Bulgarians, Servians—to secure the right to the reversion of territories not yet dethroned. But behind these lesser issues loomed the great secular rivalries of the powers, and beyond these again the vast unknown forces of the Mahomedan world, ominously stirring. The very vastness of the perils involved in any attempt at a definitive settlement compelled the powers to accept a compromise which, it was hoped, would restore tolerable conditions in the wretched country. But the "Mähring programme," concerted between the Austrian and Russian emperors in 1909, and imposed upon the Porte by the diplomatic pressure of the great powers, did not produce the effects hoped for. The hideous tale of massacres of helpless villagers by organized Greek bands, and of equally hideous, if less wholesale, reprisals by Bulgarian bands, grew rather than diminished, and reached its climax in the early months of 1908. The uselessness of the new gendarmerie, under European officers, which was to have co-operated with the Ottoman authorities in the restoration of order, was from the outsetcried by the passionate champions of the Turkish government. The sultan, indeed, could hardly be blamed for watching with a certain cynical indifference the mutual slaughter of those "Christians" whose avowed ideal was the overthrow of Mahomedan rule,

nor could he be expected to desire the smooth working of a system against which he had protested as a violation of his sovereign rights. In 1908 the powers were still united in bringing pressure to bear on the Porte to make the reforms effective; but the proposal of Great Britain to follow the precedent of the Lebanon and commit the administration of Macedonia to a Musulman governor appointed by the sultan, but removable only by consent of the powers, met with little favour either at Constantinople or among the powers whose ulterior aims might have been harboured by such an arrangement.

Such was the condition of affairs when in October 1908 the revolution in Turkey altered the whole situation. The easy and apparently complete victory of the Young Turks, and the re-establishment without a struggle of the constitution which had been in abeyance since 1876, took the whole world by surprise, and not least those who believed themselves to be most intimately acquainted with the conditions prevailing in the Ottoman empire. The question of the Near East seemed in fair way of settlement by the action of conflicting races themselves, who in the enthusiasm of newfound freedom appeared ready to forget their ancient internecine feuds and to fraternize on the common ground of constitutional liberty (see TURKEY: History). By the European powers the proclamation of the constitution was received; at least outwardly, with unanimous approval, general admiration being expressed for the singular moderation and self-restraint shown by the Turks during the revolution. On the other hand, the revolution so far as it affected the Ottoman empire itself, there could be no doubt that its effects on the general situation in Europe would be profound. These effects were not slow in revealing themselves. On the 5th of October Prince Ferdinand of Bulgaria proclaimed himself king (tsar) of the Bulgarians; and two days later the emperor Francis Joseph of Austria issued a rescript announcing the annexation of Bosnia and Herzegovina to the Hapsburg monarchy (see BULGARIA: History and BOSNIA AND HERZEGOVINA: History). Whatever cogent reasons there may have been for altering the status of these countries in view of the changed conditions in Turkey, there could be no doubt that the method employed was a violation of the public law of Europe. By the declaration of London of 1871, to which Austria-Hungary herself had been a principal party, it had been laid down that "contracting powers could not rid themselves of their treaty engagements by an understanding with their co-signatories." This solemn reaffirmation of a principle on which the whole imposing structure of international law had, during the 19th century, been laboriously built up was now cynically violated. The other powers, confronted with the fait accompli, protested; but the astute statesman who had staked his reputation as foreign minister of the Dual Monarchy on the success of this coup had well gauged the character and force of the opposition he would have to meet. Baron von Aehrenthal, himself more Slav than German, in spite of his name, had served a long apprenticeship in diplomacy at Belgrade and St Petersburg; he knew how fully he could rely upon the weakness of Russia, and that if Russian anti-Slavism could be cowed, he need fear nothing from the resentment of the Servians. He was strong, too, in the moral and—in case of need—the material support of Germany. With Germany behind her, Austria-Hungary had little to fear from the opposition of the powers of the triple entente, Great Britain, France and Russia. This diagnosis of the situation was justified by the event. For months, indeed, Europe seemed on the verge of a general war. During the autumn the nationalist excitement in Servia and Montenegro rose to fever-heat, and Austria responded by mobilizing her forces on the frontiers and arming the Catholic Bosnians as a precaution against a rising of their Orthodox compatriots. Only the winter seemed to stand between Europe and a war bound to become general, and men looked forward with apprehension to the melting of the snows. It is too early as yet to write the history of the diplomatic activities by which this disaster was avoided. Their general
outline, however, is clear enough. The protests of Turkey at a violation of treaty rights, doubly resented as likely to damage the prestige of the new constitutional régime, were sympathetically received by the powers of the triple entente. An international conference was at once suggested as the only proper authority for carrying out any modifications of the treaty of Berlin necessitated by the new conditions in Turkey; the right of Austria-Hungary to act on her own initiative was strenuously denied; Bulgarian independence and Prince Ferdinand’s title of king were meantime refused recognition. In the assertion of these principles Great Britain, Russia and France were united. Germany, on the other hand, maintained an attitude of reserve, though diplomatically “correct”; she accepted the principle of a conference, but made her consent to its convocation conditional on that of her ally Austria-Hungary. But the latter refused to agree to any conference in which the questions at issue should be reopened; the most that she would accept was a conference summoned merely to register the fait accompli and to arrange “compensations” not territorial but financial.

For a while it seemed as though Baron Aehrenthal’s ambition had o’erleaped itself. The reluctance of the Russian government, conscious of its military and political weakness, to take extreme measures seemed likely to be overborne by the Pan-Slav enthusiasm of the Russian people, and the Austrian statesman’s policy of having placed him in an impasse from which it would be difficult to extricate himself, save at an expense greater than that on which he had calculated. At this point Germany, conscious throughout of holding the key to the situation, intervened with effect. Towards the end of March 1900 the German ambassador at St Petersburg, armed with an autograph letter from the emperor William II., had an interview with the tsar. What were the arguments he used is not known; but the most powerful are supposed to have been the German forces which had been mobilized on the Polish frontier. In any case, the result was immediate and startling. Russia, without previous discussion with her allies, dissociated herself from the views she had hitherto held in common with them, and accepted the German-Austrian standpoint. All question of a conference was now at an end; and all that the powers most friendly to Turkey could do was to persuade her to make the best of a bad bargain. The Ottoman government, preoccupied with the internal questions which were to issue in the abortive attempt at counter-revolution in April, was in no condition to resist friendly or unfriendly pressure. The principle of a money payment in compensation for the shadowy rights of the sultan over the lost provinces was accepted, and Bulgarian independence under King Ferdinand was recognized on the very eve of the new victory of the Young Turks which led to the deposition of Hamid II. and the proclamation of Sultan Mahomed V. (see Turkey: History).

The change made by these events in the territorial system of Europe was of little moment. A subject principality, long practically independent, became a sovereign state; the Almanach de Gotha was enriched with a new royal title; the sentiment of the Bulgarian people was gratified by the restoration of their historic tsardom. Two provinces long annexed to the Habsburg monarchy de facto became de jure, and the vision of a Serb empire with a free outlet to the sea, never very practicable, was finally dissolved. Of vastly greater importance were the moral and international issues involved.

The whole conception of an effective concert of Europe, or of the World, based on the supposed sacred obligation of treaties and the validity of international law, was revealed, suddenly and brutally, as the baseless fabric of a dream. The most momentous outcome of the international debates caused by Austria’s high-handed action was the completion of Bismarck’s principle that treaties cease to be valid “when the private interest of those who lie under them no longer reinforces the text.” Henceforth, it was felt, no reaffirmation of a principle of international

comity and law, so successfully violated, could serve to disguise the brutal truth that in questions between nations, in the long run, might is right—that there is no middle term between the naked submission preached by Tolstoy and his disciples and Napoleon’s dictum that “Providence is with the big battalions.” In Great Britain, especially, public opinion was quick to grasp this truth. It was realized that it was the immense armed power of the European nations that had “compensated” for the non-existence of the states affecting the interests of all Europe. Germany alone emerged from the crisis with prestige enormously enhanced; for without her intervention Austria could not have resisted the pressure of the powers. The cry for disarmament, encouraged by the action of Sir Henry Campbell-Bannerman’s government, suddenly died down in England; and the agitation in favour of an increased ship-building programme, that followed the revelation by the first World War of the armaments of the Central Powers, rested on foundations of naval construction, showed that public opinion had been thoroughly awakened to the necessity of maintaining for Great Britain her maritime supremacy, on which not only her position in Europe but the existence of her over-sea empire depended.

BIBLIOGRAPHICAL NOTE.—(1) Bibliographies.—List of the principal works on the history of the various European countries, and of their main sources, are given in the bibliographies attached to the separate countries. For a more comprehensive treatment of the whole field, see: (i.) History; (ii.) Diplomacy; (iii.) Crusades; (iv.) Feudalism, &c. For the sources of the medieval history of Europe see Ulysse Chevalier’s Répertoire de la littérature historique (Paris, 1878, &c.), which, with certain limitations (notably as regards the Slav, Hungarian and Scandinavian countries) is a guide to recent and older documents for all periods. For the monarchical and the annals, chronicles and other historical works which appeared in Europe between the years 1375 and 1500 and have since been printed, the first known notes on their value and significance, and references to critical works upon them, see also the article Record. For authorities on the history of Europe from the end of the 15th to the 19th centuries inclusive the excellent bibliographies appended to the volumes of the Cambridge Modern History are invaluable.

(2) Works.—Of general works the most important are the Histoire générale du IVe siècle à nos jours, published under the direction of M. de Lasalle and A. Ramond, Paris, 1874, &c.; in 12 volumes, covering the period from the 4th to the end of the 19th century: (iv.) Leopold von Ranke’s Weltschichte (Leipzig, 1881, &c.) in 9 vols., covering the first group of the world-power of the Holy Roman Empire and the Holy Roman Empire and the Roman-German kingdoms; the Arab world-power and the empire of Charlemagne; dissolution of the Holy Roman Empire and the Latin empire; and the origin and development of the medieval empire, that of the divine and the feudalism of the German empire; the hierarchy under Gregory VII.; (viii.) crusades and papal world-power (12th and 13th centuries); (ix.) period of transition to the modern world (14th and 15th centuries). This may be added Ranke’s works on special periods: e.g. Die Fürsten und Vöbler von Süd-Europa im 16ten und 17ten Jahrhundert (2nd ed., Leipzig, 1837-1839); Geschichte der romanischen und germanischen Völker, 1494-1514 (2nd ed., Leipzig, 1874, Eng. trans., 1887). In English the most important general work is the Cambridge Modern History (1903, &c.), produced by the collaboration of English and foreign scholars, and intended as a comprehensive history of the world. For the history of Europe, the most valuable are the volumes of the “Periods of European History” series (London, 1893, &c.) in 17 vols., dealing with the history of the “Empire and the Papacy,” the “Hapsburgs,” the “I. The Dark Ages,” the “Middle Ages,” the “13th and 14th Centuries,” the “15th Century,” the “16th Century,” the “17th Century,” the “18th Century,” and the “19th Century,” or “The Ascendancy of France,” by H. O. Wadsworth (1891); The Balance of Power, by A. Harnell (1898); Revolutionary Europe, by H. Morse Stephens (1892); Modern Europe, by W. Allison Phillips (1910,
EUROPIUM—EUSEBIUS

EUSEBIUS, Laurentius (1688–1730), English poet, son of the Rev. Laurence Eusden, rector of Spofforth, Yorkshire, was baptized on the 6th of September 1688. He was educated at St Peter's school, York, and at Trinity College, Cambridge. He became a minor fellow of his college in 1711, and in the next year was admitted to a full fellowship. He was made poet laureate in 1718 by the lord chancellor, the duke of Newcastle, as a reward for a flattering poem on his marriage. He was rector of Coningsby, Lincolnshire, where he died on the 27th of September 1730. His name is less remembered by his translations and grutatul poems than by the numerous satirical allusions of Pope, e.g.

"Know, Eusden thirsts no more for sack or praise;
He sleeps among the dull of ancient days.

Dunciad, bk. i. 11. 293-294.

EUSEBIUS (Gr. EUSEBios, from εὐσέβης, pious, cf. the Latin name Pius), a name borne by a large number of bishops and others in the early ages of the Christian Church. Of these the most important are separately noticed below. No less than 25 sains of this name (sometimes corrupted into Eusegus, Eurgue, Usoge, Usuge, Urige, and St Sebia) are venerated in the Roman Catholic Church, of whom 23 are included in the Bollandist Acta Sanctorum; many are obscure martyrs, monks or anchorites, but two deserve at least a passing notice.

A P. P., bishop of Vich (d. 371), is notable not only as a stout opponent of Arianism, but also as having been, with St Augustine, the first Western bishop to unite with his clergy in adopting a strict monastic life after the Eastern model (see Ambrose, Ep. 63 ad Vercellenses, § 66). The legend that he was stoned to death by the Arians was probably invented for the edification of the Orthodox.

Eusebius, bishop of Samosata (d. 380), played a considerable part in the later stages of the Arian controversy in the East. He is first mentioned among the Homoean and Homoeans bishops who in 363 accepted the Homousian formula at the synod of Antioch presided over by Meletius, with whose views he seems to have identified himself (see MELETIUS OF ANTIAC). According to Theodoret (5, 4, 8) he was killed at Doliche in Syria, where he had gone to consecrate a bishop, by a stone cast by an Arian woman. He thus became a martyr, and found a place in the Catholic calendar (see the article by Loofs in Herzog-Hauck, Realencycl., ed. 1809, p. 620).

EUSEBIUS OF LAODICEA, though not included among the saints, was noted for his saintly life. He was an Alexandrian by birth, and gained so great a reputation for his self-denial and charity that when in 262 the city was besieged by the troops of the emperor Gallienus he obtained permission, together with Anatolius, from their commander Theodotus, to lead out the non-combatants, whom he tended "like a father and physician." He went with Anatolius to Syria, and took part in the controversy against Paul of Samosata, bishop of Antioch. He became bishop of Laodicea, probably in the following year (263), and died some time before 268. His friend Anatolius succeeded him as bishop in the latter year (see the article by E. Hennecke in Herzog-Hauck, v. 616).

EUSEBIUS, bishop of Rome for four months under the emperor Maxentius, in 309 or 310. The Christians in Rome, divided on the question of the recognition of apostates, on which Eusebius held the milder view, brought forward a competitor, Heraclius. Both competitors were expelled by the emperor, Eusebius dying in exile in Sicily. He was buried in the cemetery of St Calixtus at Rome; and the extant epitaph, in eight hexameter lines, set up here by his successor Damasus, contains all the information there is about his life.

EUSEBIUS [OF CAESAREA] (c. 260-c. 340), ecclesiastical historian, of Palestinian origin, who, called himself Eusebius Pamphilus, because of his devotion to his friend and teacher Pamphilus, was born probably in Palestine between A.D. 260 and 265, and died as bishop of Caesarea in the year 339 or 340. We know little of his youth beyond the fact that he became associated at an early day with Pamphilus, presbyter of the Church of Caesarea, and founder of a theological school there (see Hist. Eccl. vii. 37). Pamphilus gathered about him a circle of earnest students who

EUROPIUM, a metallic chemical element, symbol Eu, atomic weight 152.0 (O = 16). The oxide Eu₂O₃ occurs in very small quantity in the minerals of the rare earths, and was first obtained in 1896 by E. A. Demarçay from Lecoq de Boisbaudran's samarium; G. Urbain and H. Lacombe in 1904 obtained the pure salts by fractional crystallization of the nitric acid solution with magnesium nitrate in the presence of bismuth nitrate. The salts have a faint pink colour, and show a faint absorption spectrum; the spark spectrum is brilliant and well characterized.

EYRIDES (Εὐρίδης), in Greek mythology, the wife of Orpheus (q.v.). She was the daughter of Nereus and Doris, and died from the bite of a serpent when fleeing from Aristaeus, who wished to offer her violence (Virgil, Georgics, iv. 454-527; Ovid, Meta. x. 1, 65).

EUPHMENIDES, one of the Athenian generals during the Peloponnesian War. In 428 B.C. he was sent by the Athenians to intercept the Peloponnesian fleet which was on the way to attack Corcyra. On his arrival, finding that Nicostratus with a small squadron from Naupactus had already placed the island in security, he took the command of the combined fleet, which, owing to the absence of the enemy, had no chance of distinguishing itself. In the following summer, in joint command of the land forces, he ravaged the district of Tanagra; and in 425 B.C. he was appointed, with Sophocles, the son of Sostratus, to the command of an expedition destined for Sicily. Having touched at Corcyra on the way, in order to assist the democratic party against the oligarchical exiles, but without taking any steps to prevent the massacre of the latter, Eurymenon proceeded to Sicily. Immediately after his arrival a pacification was concluded by Hermocrates, to which Eurymanon and Sophocles were parties, but his efforts to agree. The terms of Tanagra; and in 425 B.C. he was; however, satisfy the Athenians, who attributed its conclusion to bribery; two of the chief agents in the negotiations were banished, while Eurymenon was sentenced to pay a heavy fine. In 414 Eurymenon, who had been sent with Demosthenes to reinforce the Athenians at the siege of Syracuse, was defeated and slain before reaching land (Thucydides iii., iv., viii.; Diod. Sic. xiii. 8, 11, 13).
devoted themselves especially to the study of the Bibli and the transcription of Biblical codices, and also to the defence and spread of the writings of Origen, whom they regarded as their master. Pamphilus had a magnificent library, which Eusebius made diligent use of, and a catalogue of which he published in his lost Life of Pamphilus (Hist. Eccl. vi. 32). In the course of the Diocletian persecution, which broke out in 303, Pamphilus was imprisoned for two years, and finally suffered martyrdom. During the historian's imprisonment (307–90) Eusebius distinguished himself by assiduous devotion to his friend, and assisted him in the preparation of an apology for Origen's teaching (Hist. Eccl. vi. 33), the first book of which survives in the Latin of Rufinus (printed in Routh's Reliquiae Sacrae, iv. 339 sq., and in Lommatzsch's edition of Origen's Works, xxiv. p. 293 sq.). After the death of Pamphilus Eusebius withdrew to Tyre, and later, while the Diocletian persecution was still raging, went to Egypt, where he seems to have been imprisoned, but soon released. He became bishop of Caesarea between 313 and 315, and remained such until his death. The patriarchate of Antioch was offered him in 331, but declined (Vita Constantini, iii. 59 sq.).

Eusebius was a very important figure in the church of his day. He was not a great theologian nor a profound thinker, but he was the most learned man of his age, and stood high in favour with the emperor Constantine. At the council of Nicaea in 325 he took a prominent part, occupying a seat at the emperor's right hand, and being appointed apologist in honour of his position. He was the leader of the middle party at the council, and submitted the first draft of the creed which was afterwards adopted with important changes and additions. In the beginning he was the most influential man present, but was finally forced to yield to the Alexandrian party, and to vote for a creed which completely repudiated the position of the Arians, with whom he had himself been hitherto more in sympathy than with the Alexandrians. He was placed in a difficult predicament by the action of the council, and his letter to the Caesarean church explaining his conduct is exceedingly interesting and instructive (see Socrates, Hist. Eccl. i. 8, and cf. McNeill's translation of Eusebius' Church History, p. 15 sq.). To understand his conduct, it is necessary to look briefly at his theological position. By many he has been called an Arian, by many his orthodoxy has been defended. The truth is, three stages are to be distinguished in his theological development. The first preceded the outbreak of the Arian controversy, when, as might be expected in a follower of Origen, his interest was anti-Sabellian and his chief emphasis upon the subordination of the Son of God. In his works written during this period (for instance, the Præparatio evangelica and Demonstratio evangelica), as in the works of Origen himself and other ante-Nicene fathers, expressions occur looking in the direction of Arianism, and others looking in the opposite direction. The second stage began with the outbreak of the controversy in 318, and continued until the Nicene Council. During this period he took the side of Arians in the dispute with Alexander of Alexandria, and accepted what he understood to be the position of Arians and his supporters, who, as he supposed, taught both the divinity and subordination of the Son. It was natural that he should take this side, for in his traditional fear of Sabellianism, in which he was one with the followers of Origen in general, he found it difficult to approve the position of Alexander, who seemed to be doing away altogether with the subordination of the Son. And, moreover, he believed that Alexander was misrepresenting the teaching of Arians and was doing him great injustice (cf. his letters to Alexander and Euphronius preserved in the proceedings of the second council of Nicaea, Act. vi. tom. 5: see Mann's Concilia, xiii. 316 sq.; English translation in McNeill, op. cit. p. 70). Meanwhile at the council of Nicaea he seems to have discovered that the 'moderns' were right in claiming that he was carrying his subordinationism so far as to deny all real divinity to Christ. To this length Eusebius himself was unwilling to go; and, so, convinced that he had misunderstood Arians, and that the teaching of the latter was imputing the historic belief in the divinity of Christ, he gave his support to the opposition, and voted for the Nicene Creed, in which the teachings of the Arians were repudiated. From this time on he was a supporter of Nicene orthodoxy over against Arianism (cf., e.g., his Contra Marcellum, De ecclesiasticis theologis, and Theophania). But he never felt in sympathy with the extreme views of the Athanasian party, for they seemed to him to savour of Sabellianism, which always remained his chief dread (cf. his two works against Marcellus of Ancyra). His personal friends, moreover, were principally among the Arians, and he was more closely identified with them than with the supporters of Athanasius. But he was always a man of peace, and while commonly counted one of the opponents of Athanasius, he did not take a place of leadership among them as his position and standing would have justified him in doing, and Athanasius never spoke of him with bitterness as he did of other prominent men in the party. (For a fuller description of the development of Eusebius' Christology and of his attitude throughout the Arian controversy, see McNeill, op. cit. p. 11 sq.)

Eusebius was one of the most voluminous writers of antiquity, and his labours covered almost every field of theological learning. If we look in his works for brilliancy and originality we shall be disappointed. He was not a creative genius like Origen or Augustine. His claim to greatness rests upon his vast erudition and his sound judgment. Nearly all his works possess genuine and solid merit which raises them above the commonplace, and being carefully selected he has sought to make them still remain valuable. His expenditure of energy on the various topics of his system was enormous; that most of his contemporaries, and his apologetic is marked by fairness of statement, breadth of treatment, and an appreciative appreciation of the development of the Church. He was a man of great historical sense, and his interpretation of the events and of the division of his time and his people was often the result of a careful revision. Ideas of all sorts poured in upon him while he was writing, and he was not always able to resist the temptation to insert them whether pertinent or not. His great learning is evident everywhere, but he is often his slave rather than its master. It is as an historian that he is best known, and to his History of the Christian Church he owes his fame and his familiar title "The Father of Christian History." This work, which was published in its final form in ten books in 342 or early in 355, is the most important ecclesiastical history produced in ancient times. The reasons leading to the great undertaking, in which Eusebius had no predecessors, were in part historical, in part apologetic. He believed that he was living at the beginning of a new age, and that he felt that it was a fitting time, when the order of things was passing away, to put on record for the benefit of posterity the great events which had occurred during the generations that were past. He thus wrote, as any historian might, for the information and instruction of his readers, and yet he had all the time an apologetic purpose, to exhibit to the world the history of Christianity as a proof of its divine origin and efficacy. His plan is stated at the very beginning of the work:

'It is my purpose to write an account of the successions of the holy Apostles as well as of the times which have elapsed from the coming of our Saviour to the present day; to relate how and at what events are said to have occurred in the history of the church; and to mention those who have governed and presided over the church in the most prominent parishes, and those who in each generation have claimed the divine word either orally or in writing. It is my purpose also to give the names and number and times of those who through love of innovation have run into the greatest errors, and proclaiming themselves discoverers of knowledge, falsely so called, have like fierce wolves unmercifully devastated the flock of Christ. It is my intention, moreover, to recount the misfortunes which have occurred among Christians, whether of the various parties, and the obstacles which our Saviour has set in their way, and the destruction of the churches which have been made in our own day, and the gracious and kindly succour which our Saviour has accorded them all.'

The value of the work does not lie in its literary merit, but in the wealth of the materials which it furnishes for a knowledge
of the early church. Many prominent figures of the first three centuries are known to us only from its pages. Many fragments, priceless on account of the light which they shed upon movements of far-reaching consequence, have been preserved in it alone. Eusebius often fails to appreciate the significance of the events which he records; in many cases he draws unwarranted conclusions from the given premises; he sometimes misinterprets his documents and misunderstands men and movements; but usually he presents us with the material upon which we base our judgment, and if we differ with him we must at the same time thank him for the data that enable us independently to reach other results. But the work is not merely a thesaurus, it is a history in a true sense, and it has an intrinsic value of its own, independent of its quotations from other works. Eusebius possessed extensive sources of knowledge no longer accessible to us. The number of books referred to as read is enormous. He also had access to the archives of state, and gathered from them information beyond the reach of most. But the value of his work is due, not simply to the sources employed, but also to the use made of them. Upon this matter there has been, it is true, some diversity of opinion among modern scholars, but it is now generally admitted, and can be abundantly shown, that he was not only diligent in gathering material, but also far more thorough-going than most writers of antiquity in discriminating between trustworthy and untrustworthy reports, frank in acknowledging his sources, and indicating his mistakes. He is in doubtful cases, less credulous than most of his contemporaries, and unfailingly honest. His principal faults are his carelessness and inaccuracy in matters of chronology, his lack of artistic skill in the presentation of his material, his desultory method of treatment, and his failure to look below the surface and grasp the real significance and vital connexions of events. He commonly regards an occurrence as sufficiently accounted for when it is ascribed to divine agency. But in so doing the Church History is a monumental work, which need only be compared with its continuations by Socrates, Sozomen, Theodoret, Rufinus and others, to be appreciated at its true worth.

In addition to the Church History we have from Eusebius' pen a Chronicle in two books (c. 303; later continued down to 323), of which an epitome occurs in the second chronological tables exhibiting in parallel columns the royal succession in different nations, and accompanied by notes marking the dates of historical events in the editions of 1742, 1745, and 1773. A revised edition of the second continuation down to his own day was published in Latin by St. Jerome, and this, together with some fragments of the original Greek, was our only source for a knowledge of the Chronicle until the discovery of a Latin translation in 1881. The History of the Church was published separately. Thus the Church History, first by Socrates (Paris, 1554); by Vaesius with copious notes, together with the Life of Constantine; by Sozomen, and finally by Theodoret. The Life of Constantine was published in 1854 by Vaesius, Heinichen and others in their editions of the Church History, also in the first volume of the Berlin Academy's ed. by Heidel); and an English translation by Richardson in the volume containing McGiffert's translation of the Church History. Gaisford published the Prophetic Extracts (Oxford, 1842), the Demonstratio evangeliaca (1852), and the works against Marcellus appear in the edition of the Berlin Academy (vol. i. of the New York, vol. 1). The Theophania was first published by Lee (Syracuse, 1842; English translation, 1843). German translation of the Syrian version, with the Theophania, was also contained in the edition of the Berlin Academy (vol. iii.). The works against Marcellus have appeared in the edition of the Berlin Academy (vol. iv.). The Christian, published by Lagarde and Bizart, in 1871, 1st ed. 1860, was largely rewritten, and only the first ten editions and fragments of the original Greek, is given in the edition of the Berlin Academy (vol. iii.).

The Life of Constantine, in four books, published after the death of the emperor (c. 357), is of great interest to students of the history of the Church, but contains much valuable material. Of Eusebius' apologetic works we still have the Contro Hieroclem, Demonstratio evangeliaca, and Theophania. The first is a reply to a lost work against the Christians written by Hierocles, a Roman emperor and contemporary of Eusebius. The second and third, taken together, are the most elaborate and important apologetic works of the first three centuries. The former was written in twenty books, and the two together constitute a defense of Christianity against all the world, heathen as well as Jews. In grandeur of conception, comprehensiveness of treatment, and thoroughness of learning, they are unmatched in church histories, histories of Christian literature, encyclopedia, &c., may be mentioned a monograph by Stein, Eusebius Bischof von Caesarea (Würzburg, 1859), meagre but useful as far as it goes; the monumental work by Lightfoot in the Dictionary of Christian Biography; the account by McGiffert in his translation of the Church History; Erwin Preuschen's article in Herzog-Hauck, Realencyklopädie der Christianen, Altertumskunde und Philosophie, die Geschichtsschreibung des 4. Jahrhunderts, 2. edition, the writings of Bardenhewer's Patrologia, ii. 2, p. 106 sq.; and Bardenhewer's Patrologia, ii. 2. The many
special discussions of Eusebius' separate works, particularly of his Church History, and of his character as an historian, cannot be refuted. His apologetic bibliography will be found in McKenna's translation, and in Preusch's article in Herzog-Hauck. (A.C. McG.)

EUSEBIUS (OF EMESIA) (d. c. 360), a learned ecclesiastic of the Greek church, was born at Edessa about the beginning of the 4th century. After receiving his early education in his native town, he studied theology at Caesarea and Antioch and philosophy and science at Alexandria. Among his teachers were Eusebius of Caesarea and Patrophilius of Scythopolis. The reputation he acquired for learning and eloquence led to his being offered the see of Alexandria in succession to the deposed Athanasius at the beginning of 339, but he declined, and the council (of Antioch) chose Gregory of Cappadocia, "a fitter agent for the rough work to be done." Eusebius accepted the small bishopric of Emessa (the modern Homs) in Phoenicia, but his powers as mathematician and astronomer led his flock to accuse him of practising sorcery, and he had to flee to Laodicea. A reconciliation was effected by the patriarch of Antioch, but tradition says that Eusebius finally resigned his charge and lived a studious life in Antioch. His fame as an astrologer commended him to the emperor Constantius II, who in the school became a great favourite, accompanying him on many of his expeditions. The theological sympathies of Eusebius were with the semi-Arian party, but his interest in the controversy was not strong. His life was written by his friend George of Laodicea. He was a man of extraordinary learning, great eloquence and considerable intellectual power, but of his numerous writings only a few fragments are now in existence.

See Migne, Patrologia Graeca, vol. lxxxvi.

EUSEBIUS (OF MYRNOS), Greek philosopher, a distinguished Neoplatonist and pupil of Aedesius, who lived in the time of Julian, and who is described by Eunapius as one of the "Golden Chain" of Neoplatonism. He ventured to criticize the magical and theurgic side of the doctrine, and exasperated the emperor, who preferred the mysticism of Maximus and Chrysanthius. He devoted himself principally to logic. Stobaeus in the Sermones collected a number of ethical dicta of one Eusebius, who may perhaps be identical with the Neoplatonist.

The fragments have been collected by Mullach in his Fragmenta Phil. Graec., and by Orelli, in Opuscula veter. graec. sestern. et moral.

EUSEBIUS (OF NICOMEDIA) (d. 341?), Greek bishop and theologian, was the defender of Arius in a still more avowed manner than his namesake of Caesarea, and from him the Eusebian or middle party specially derived its name, giving him in return the epithet of Great. He was a contemporary of the bishop of Caesarea, and united with him in the enjoyment of the friendship and respect of the imperial family. He is said to have been connected by his mother with the emperor Julian, whose early tutor he was. His first bishopric was Berytus (Beirut) in Phoenicia, but his name is especially identified with the see of Nicomedia, which, from the time of Diocletian till Constantine established his court at Byzantium, was regarded as the capital of the eastern part of the empire. He warmly espoused the cause of Arius in his quarrel with his bishop Alexander, and wrote a letter in his defence to Paulinus, bishop of Tyre, which is preserved in the Church History of Theodoretus. Unlike Lucian of Antioch, his views appear to have been identical with those of Eusebius of Caesarea in placing Christ above all created beings, the only bogotten of the Father, but in refusing to recognize him to be "of the same substance" with the Father, who is alone in essence and absolute being.

At the council of Nicaea Eusebius of Nicomedia earnestly opposed, along with his namesake of Caesarea, the insertion of the Homousian clause, but after being defeated in his object, he also signed the creed in his own sense of ἡμοιος κατ' οἴκον. He refused, however, to sign the anathema directed against the Arians, not, as he afterwards explained, because of his variance from the Athanasian theology, but "because he doubted whether Arius really held what the anathema imputed to him" (Sozom. ii. 15). After the council he continued vigorously to espouse the Arian cause, and was so far carried away in his zeal against the Athanasians that he was temporarily banished from his see as a disturber of the peace of the church. But his alienation from the court was of short duration. He retained the confidence of the emperor's sister Constantia, through whose influence he was promoted to the see of Nicomedia, and by her favour he was restored to his position, and speedily acquired an equal ascendancy over the emperor. But in the time of the latter's sudden death, 336, it was chiefly through his menace, as representing the emperor, that the church of Constantinople was thrown into anxiety as to whether the leader should be readmitted to the bosom of the church. The death of Constantine followed hard upon that of Arius; and Eusebius, who was promoted in 339 to the see of Constantinople, became the leader of the anti Nicene party till his own death in (probably) 341. The real active Ephesius and his party must be studied in connexion with the Arian controversy (see Arians).

EUSKIRKEN, a town of Germany, in the Prussian Rhine province, on a plateau lying to the E. of the Eiffel range, at the junction of railways from Cologne and Bonn and 10 m. W. of the latter. Pop. (1905) 10,285. It has an Evangelical and a Roman Catholic church, and its industries include cloth, sugar and stock manufactures, besides breweries and tanneries.

EUSTACE, the name of four counts of Boulogne.

Eustace I., a son of Count Baldwin II., held the county from 1046 until his death in 1049.

His son, EUSTACE II. (d. 1053), count of Boulogne, was the husband of Goda, daughter of the English king Æthelred the Unready, and aunt of Edward the Confessor. Eustace paid a visit to England in 1051, and was honourably received at the Confessor's court. A brawl in which he and his servants became involved with the citizens of Dover led to a serious quarrel between the king and Earl Godwine. The latter, to whose jurisdiction the men of Dover were subject, refused to punish them. His contumacy was made the excuse for the outlawry of himself and his family. In 1066 Eustace came to England with Duke William, and fought at the battle of Hastings. In the following year, probably because he was dissatisfied with his share of the spoil, he assisted the Kentishmen in an attempt to seize Dover Castle. The conspiracy failed, and Eustace was sentenced to restore his English fiefs. Subsequently he was reconciled to the Conqueror, who restored a portion of the confiscated lands.

Eustace died in 1053, and was succeeded by his son, EUSTACE III., who went on crusade in 1066, and died about 1125. On his death the county of Boulogne came to his daughter, Matilda, and her husband Stephen, count of Blois, afterwards king of England, and in 1150 it was given to their son, Eustace IV.

EUSTACE IV. (d. 1153) became the heir-apparent to his father's possessions by the death of an elder brother before 1135. In 1137 he did homage for Normandy to Louis VII. of France, whose sister, Constance, he subsequently married. Eustace was knighted in 1147, at which date he was probably from sixteen to eighteen years of age; and in 1151 he joined Louis in an abortive raid upon Normandy, which had accepted the title of the emperor Matilda, and was now defended by her husband, Geoffrey of Anjou. At a council held in London on the 6th of April 1152 Stephen induced a small number of barons to do homage to Eustace as the future count of Boulogne. But the other barons declined to perform the coronation ceremony on the ground that the Roman curia had declared against the claim of Eustace. The death of Eustace, which occurred during the next year, was hailed with general satisfaction as opening the possibility of a peaceful settlement between Stephen and his rival, the young Henry of Anjou. The Peleborough Chronicle, not content with voicing this sentiment, gives Eustace a bad
EUSTATHIUS--EUTIN

character. "He was an evil man and did more harm than good wherever he went; he spoiled the lands and laid three heavy taxes." He had used threats against the recalcitrant bishops, and in the war against the Angenii party had demanded contributions from religious houses; these facts perhaps suffice to account for the verdict of the chronicler.

EUSTATHIUS, of Antioch, sometimes styled "the Great" (fl. 325), was a native of Side in Pamphylia. About 320 he was bishop of Beroea, and he was patriarch of Antioch before the council of Nicea in 325. In that assembly he distinguished himself by his zeal against the Arians, although the All-Nicomachian Epistolae with which he has been credited is hardly genuine.

His anti-Arian polemic against Eusebius made him unpopular among his fellow-bishops in the East, and a synod convened at Antioch in 330 passed a sentence of deposition, which was confirmed by the emperor. He was banished to Trajanopolis in Thrace, where he died, probably about 337, though possibly not till 350.

The only complete work by Eustathius now extant is the De Exordiis et Origine Animae (ed. by A. Jahn in Texte und Untersuchungen, ii. 4). Other fragments are enumerated by F. Loofs in Herzog-Hauck's Realencyclopaedie.

EUSTATHIUS, of Eutychianus, surnamed Macromblothius ("living near the long bazaars"), the last of the Greek romancers writing in the second half of the 12th century A.D. His title Protosololobismus shows him to have been a person of distinction, and if he is also correctly described in the MSS. as μυθαρχωροφιλακ (chief keeper of the ecclesiastical archives), he must have been a Christian. He was the author of The Story of Hymerte and Hyermias in eleven books, a tedious and inferior imitation of the Cleiophon and Leucippe of Achilles Tatius. There is nothing original in the plot, and the work is tasteless and ornate, though some of the language is borrowed from the Greek, and other Attic poets, the chief source of his phraseology was the rhetorician Choricius of Gaza. The style is remarkable for the absence of hiatus and an extremely laboured use of antithesis.

The digressions on works of art, apparently the result of personal observation, are the best part of the work. A collection of twelve Riddles, of which solutions were written by the grammarian Manuel Holobolos, is also attributed to Eustathius.

The best editions of the Eutychianus' Riddles is by I. Hilberg (1821); the best modern edition of the Riddles alone is by M. Tru (1823). On Eustathius generally, see C. Dunlop, History of Fiction (1888, new ed. in Bohn's Standard Library): E. Rohde, Der griechische Roman (1900); K. Krumbacher, Geschichte der byzantinischen Literatur (1897). There are many references in modern languages in which a work by P. J. Reis (1825) may be recommended; there is an English version from the French by L. H. le Moine (London and Paris, 1878).

EUSTATHIUS, archbishop of Thessalonica, Byzantine scholar and author (probably a native of Constantinople), flourished during the second half of the 12th century. He was at first a monk, and afterwards descom of St Sophia and teacher of rhetoric in his native city. In 1174 he was chosen bishop of Myra in Lycia, but in 1175 was transferred to Thessalonica. He was unspotted and independent, and did not hesitate to oppose the emperor Manuel, when the latter desired an alteration in the formula of abjuration necessary for converts from Mahomedanism. In 1185, when Thessalonica was captured by the Normans under William II. of Sicily, Eustathius secured religious toleration for the conquered. He died about 1193. His best known work is Commentary on the Greek New Testament, a short, vivid, valuable, and critical compilations, valuable as containing numerous extracts from the scholia of other critics, whose works have now perished. He also wrote a commentary on the geographical epic of Dionysius Periegetes, in which much of Stephanus of Byzantium and the lost writings of Arrian is preserved. A commentary on Findar has been lost, with the exception of the preface, which contains an essay on lyric poetry, a life of Pindar; and an account of the Olympic games. A history of the conquest of Thessalonica by the Normans, a congratulatory address to the emperor. Manuel, a plea for an improved water-supply for Constantinople, and an extensive correspondence with clerical and lay dignitaries, are evidence of his versatility. He is also the author of various religious works, chiefly directed against the prevailing abuses of his time, which almost anticipate, though in a milder form, the denunciations of Luther; the most important of these is The Form of Monastic Life, A commentary on the penecostal hymn of John of Damascus may also be mentioned.

Editions: Homer Commentary, by G. Stalbaum (1893-1890); preface to Pindar Commentary, by F. W. Schneidewijn (1837); Dionysius Complinius Fragments, Gregory of Nyssa Commentary (ed. by W. Regel, Fontes rerum Byzantinarum, i. 1841). The smaller works have been edited (1832) and the De Thessalonica (1839) by L. F. Tafel; many will be found in J. P. Migne, Patrologia Graeca, cxxxv, cxxxvi. Five new speeches have been edited by W. Regel, Fontes rerum Byzantinarum, i. (1892).

EUSTYLY (from Gr. ευστυλ, well, and ευθυς, equal), the architectural term for the intercolumniation defined by Vitruvius (ii. 3) as being of the best proportion, i.e. two and a half diameters (see INTERCOLUMNATION).

EUTAWVILLE, a town of Berkeley county, South Carolina, U.S.A., about 55 m. N.N.W. of Charleston. Pop. (1800) 244; (1800) 305. It is served by the Atlantic Coast Line railway. The town lies on high ground near the Santee river, in a region abounding in swamps, limestone cliffs and pine forests. At present its chief interest is in lumber, but in colonial days it was a settlement of aristocratic rice planters. The neighbouring Eutaw Springs issue first from the foot of a hill and form a large stream of clear, cool water, but this, only a few yards away, again rushes underground to reappear about 10 m. further on. At Eutaw Springs, on the 8th of September 1781, was fought the last battle in the field in the Southern States during the War of American Independence. About 2300 Americans under General Nathanael Greene here attacked a slightly inferior force under Colonel Alexander Stewart; at first the Americans drove the British before them, but later in the day the latter took a position in a brick house and behind palisades, and from this position the Americans were unable to drive them. On the night of the 9th, however, Colonel Stewart retreated toward Charleston, abandoning 1000 stand of arms. The battle has been classed as a tactical victory for the British and a strategical advantage for the Americans, terminating a campaign which left General Greene in virtual possession of the Carolinas, the British thereafter confining themselves to Charleston. The Americans lost in killed and wounded 498 men (including Colonel William Washington, wounded and captured), the British, 693.

EUTHYDEMUS, a native of Magnesia, who overthrew the dynasty of Didotias of Bactria, and became king of Bactria about 250 B.C. (Polyb. xi. 34; Strabo xi. i. 515 wrongly makes him the first king). In 208 he was attacked by Antiochus the Great, whom he tried in vain to resist on the shores of the river Arius, the modern Herirud (Polyb. x. 49). The war lasted three years, and was on the whole fortunate for Antiochus. But he saw that he was not able to subdue Bactria and Sogdiana, and so in 206 concluded a peace with Euthydemus, through the mediation of his son Demetrius, in which he recognized him as king (Polyb. xi. 34). Soon afterwards Demetrius (98 B.C.) began the conquest of India. There exist many coins of Euthydemus; those on which he is called god are struck by the later king Agathocles. Other coins with the name Euthydemus, which show a youthful face, are presumably those of Euthydemus II., who cannot have ruled long and was probably a son of Demetrius I. of Bactria (see Odyssey (E.D.M.)

EUTIN, a town of Germany, capital of the principality of Lübeck, which is an enclave in the Prussian province of Schleswig-Holstein and belongs to the grand-duchy of Oldenburg, picturesquely situated on the Lake Eutin, 20 m. N. from Lübeck by the railway to Kiel. Pop. (1905) 5204. It possesses a Roman Catholic and two Protestant churches, a palace with a fine park, and a monument to Weber, the composer, who was...
born here. Towards the end of the 18th century Eutin acquired some fame as the residence of a group of poets and writers, of whom the best-known were Johann Heinrich Voss, the brothers Stolberg, and Friedrich Heinrich Jacobi. In the neighbourhood is a beautiful tract of country, rich in beech forests and fjords, known as the Schwarzwald. Eutin was a Swiss town, largely frequented in summer by the Hamburger.

Eutin was, according to tradition, founded by Count Adolf II of Holstein. In 1157 it fell to the bishopric of Lübeck and was often the residence of the prelates of that see. After some vicissitudes of fortune during the middle ages and the Thirty Years' War, it came into the possession of the house of Holstein, and hence to Prussia in 1866. Eutin is a Roman historian, flourished in the latter half of the 4th century A.D. He held the office of secretary (magister memoriae) atConstantinople, accompanied Julian on his expedition against the Persians (363), and was alive during the reign of Valens (364–378), to whom he dedicates his history. This work (Breviarium historiae Romanae) is a complete compendium, in ten books, of Roman history from the foundation of the city to the accession of Valens. It was compiled with considerable care from Paulus Diaconus' epistolae flavi and written generally without impartiality, and in a clear and simple style. Although the Latin in some instances differs from that of the purest models, the work was for a long time a favourite elementary school-book. Its independent value is small, but it sometimes fills a gap left by the more authoritative works. The Breviarium was enlarged and continued down to the time of Justinian by Paulus Diaconus (q.v.); the work of the latter was in turn enlarged by Landolfus Sagax (c. 1000), and taken down to the time of the emperor Leo the Armenian (819–830) in the Historia Missiella.

Of the Greek translations by Capito Lycius and Paeanius, the version of the latter is extant in an almost complete state. The best edition of Eutropius is by H. Droysen (1879), containing the Greek version and the enlarged editions of Paulus Diaconus and Landolfus, smaller critical editions, C. Wagener (1884), F. Rihl (1887). J. Sorn's Der Sprachgebrauch des Historikers Eutropius (1892) contains a systematic account of the grammar and style of the author. There are numerous English school editions and translations.

Eutyches (c. 380–c. 450), a presbyter and archimandrite at Constantinople, first came into notice in A.D. 431 at the council of Ephesus, where, as a zealous adherent of Cyril (q.v.) of Alexandria, he vehemently opposed the doctrine of the Nestorians (q.v.). They were accused of teaching that the divine nature was not incarnated in but only attendant on Jesus, being superadded to his human nature after the latter was completely formed. In opposition to this Eutyches went so far as to affirm that after the union of the two natures, the human and the divine, Christ had only one nature, that of the incarnate Word, and that therefore His human body was essentially different from other human bodies. In this he went beyond Cyril and the Alexandrine school generally, who, although they expressed the unity of the two natures in Christ so as almost to nullify their duality, yet took care verbally to guard themselves against the accusation of in any way circumscribing or modifying his real and true humanity. It would seem, however, that Eutyches differed from the Alexandrine school chiefly from inability to express his meaning with proper safeguards, for equally with them he denied that Christ's human nature was either transmuted or absorbed into his divine nature. The energy and imprudence of Eutyches in asserting his opinions led to his being accused of heresy by Domnus of Antioch and Eusebius, bishop of Dorylaeum, at a synod presided over by Flavian at Constantinople in 448. As his explanations were not considered satisfactory, the council deposed him from his priestly office and excommunicated him; but in 449, at a council held in Ephesus convened by Dioscurus of Alexandria and overawed by the presence of a large number of Egyptian monks, not only was Eutyches reinstated in his office, but Eusebius, Domnus and Flavian, his chief opponents, were deposed, and the Alexandrine doctrine of the "one nature" received the sanction of the church. This judgment is the more interesting as being in distinct conflict with the opinion of the bishop of Rome—Leo—who, departing from the policy of his predecessor Celestine, had written very strongly to Flavian in support of the doctrine of the two natures and one person. Meanwhile the emperor Theodosius died, and Pulcheria and Marcian who succeeded summoned, in October 453, a council (the fourth ecumenical) which met at Chalcedon (q.v.). There the doctrine of Eutyches was condemned by the name of Jacob, who united the various divisions into which the Eutychians, or Monophysites (q.v.), had separated into one church, which exists at the present time under the name of the Jacobite Church, and has numerous adherents in Armenia, Egypt and Ethiopia.

Eutychius, Pope from 275 to 283. His original epitaph was discovered in the catacombs (see Kraus, Roma soltrenns, p. 154 et seq.), but nothing more is known of him.

Eutychides, of Sicyon in Achaea, Greek sculptor of the latter part of the 4th century B.C., was a pupil of Lysippus. His most noted work was a statue of Fortune, which he made for the city of Antioch, then newly founded. The goddes, who embodied the idea of the city, was seated on a rock, crowned with towers, and having the river Orontes by her feet. There is a small copy of the statue in the Vatican (see Greek Art). It was imitated by a number of Asiatic cities; and indeed most statues of cities since erected borrow something from the work of Eutychides.

Euyuk, or Euyuk (the eu pronounced as in French), a small village in Asia Minor, in the Angora vilayet, 12 m. N.E. of Bog haz Keui (Pieria), built on a mound which contains some remarkable ruins of a large building—a palace or sanctuary—antique to the Greek period and belonging to the same civilization as the ruins and rock-reliefs at Pteria. These ruins consist of a gateway and an approach enclosed by two lateral walls, 15 ft. long, from the outer end of which two walls return outwards at right angles, one to right and one to left. The gateway is flanked by two huge blocks, each carved in front into the shape of a sphinx, while on the inner face is a relief of a two-headed eagle with wings spread. Of the approach and its returning walls only the lower courses remain: they consist of large blocks adorned with a series of bas-reliefs similar in type to those carved on the rocks of Bog haz Keui. Behind the gateway is another vestibule leading to another portal which gives entrance to the building, the lateral walls and abutments of the portal being also decorated with reliefs much worn. These reliefs belong to that pre-Greek oriental art generally called Hittite, of which there are numerous remains in the eastern half of the peninsula. It is now generally agreed that the scenes represented are religious processions. On the left returning wall is a train of priestly attendants headed by the chief priest and priestess (the latter carrying a litus), clad in the dress of the deities they serve and facing an altar, behind which is an image of a bull on a pedestal (representing the god); then comes an attendant leading a goat and three rams for sacrifice, followed by more priests with litai or musical instruments, after whom comes a bull-bearing on his back the sacred cista (?). On the lateral walls of the approach we have a similar procession of attendants led by the chief priestess and priest, who pours a libation at the feet of the goddess seated on her throne; while on the right returning wall are fragments of a third procession approaching another draped figure of the goddess on her throne (placed at the angle opposite the bull on the pedestal), the train being again brought up by a bull.

These are all scenes in the ritual of the Indigenous naturalistic
EVAGORAS—EVANGELICAL ALLIANCE

religion which was spread, in slightly varying forms, all over Asia Minor, and consisted in the worship of the self-reproductive powers of nature, personified in the great mother-goddes (called by various names Cybele, Leto, Artemis, &c.) and the god her husband-and-son (Atis, Men, Sabazios, &c.), representing the two elements of the ultimate divine nature (see GREAT MOTHER OF THE GODS). Here, as in the oriental mysteries generally, the godliness is made more prominent. Where Greek influence affects the native religion, emphasis tends to be laid on the god, but the character of the religion remains everywhere ultimately the same (see RAESBY, Cities and Bishops of Phrygia, ch. iii.).

EVAGORAS, son of Nicocles, king of Salamis in Cyprus 410-374 B.C. He claimed descent from Teucer, half-brother of Ajax, son of Telamon, and his family had long been rulers of Salamis until supplanted by a Phoenician exile. When the usurper was in turn driven out by a Cyprian noble, Evagoras, fearing that his life was in danger, fled to Cilicia. Thence he returned secretly in 410, and with the aid of a small band of adherents regained possession of the throne, according to what was later, however, read with caution, Evagoras was a model ruler, whose aim was to promote the welfare of his state and of his subjects by the cultivation of Greek refinement and civilization, which had been almost obliterated in Salamis by a long period of barbarian rule. He cultivated the friendship of the Athenians, and after the defeat of Conon at Aegospotami he afforded him refuge and hospitality. For a time he also maintained friendly relations with Persia, and secured the aid of Artaxerxes II. for Athens against Sparta. He took part in the battle of Cnidus (394), in which the Spartan fleet was defeated, and for this service his statue was placed by the Athenians side by side with that of Conon in the Ceramicus. But the energy and enterprise of Evagoras soon roused the jealousy of the Great King, and relations between them became strained. From 392 they were virtually at war. Aided by the Athenians and the Egyptian Hakor (Acoria), Evagoras extended his rule over the greater part of Cyprus, crossed over to Asia Minor, took several cities in Phoenicia, and persuaded the Cilicians to revolt. After the peace of Antalcidas (387), to which he refused to agree, the Athenians withdrew their support, since by its terms they recognized the lordship of Persia over Cyprus. For ten years Evagoras carried on hostilities single-handed, except for occasional aid from Egypt. At last he was totally defeated at Cithium, and compelled to flee to Salamis. Here, although closely blockaded, he managed to hold his ground, and with great skill managed to make Persia generals to conclude peace (376). Evagoras was allowed to remain nominally king of Salamis, but in reality a vassal of Persia, to which he was to pay a yearly tribute. The chronology of the last part of his reign is uncertain. In 374 he was assassinated by a eunuch from motives of private revenge.

The chief authority for the life of Evagoras is the panegyric of Isocrates addressed to his son Nicocles; see also Dio. Lec. 115, 16; Xenophon, Hellenica, iv. 8; W. J. de Bode, Kleinasiatische Studien (Marburg, 1892), and art. HELLENISM.

EVANGRIUS (c. 536-600), surnamed Scholasticus, Church historian, was born at Epiphania in Coele-Syria. His surname shows him to have been an advocate, and it is supposed that he practised at Antioch. He was the legal adviser of Gregory, patriarch of that city, whom he successfully defended at Constantinople against certain serious charges. Through this connexion he was brought under the notice of the emperor Tiberius Constantine, who honoured him with the rank of quaestorius; Maurice Tiberius made him master of the rolls. His influence and reputation were so considerable that on the occasion of his second marriage a public festival was celebrated in his honour, which was interrupted by a terrible earthquake. Evagrius’s name has been preserved by his Ecclesiastical History in six books, extending over the period from the third general council (that of Ephesus, 431) to the year 503. It thus continues the work of Eusebius, Socrates, Sozomen and Theodoret. Though not wholly trustworthy, and often very credulous, this work is on the whole impartial, and appears to have been compiled from original documents, from which many valuable excerpts are given. It is particularly helpful to the student of the history of dogma during the 5th and 6th centuries, while the political history of the period is not without its interest. There is an English translation in Bohn’s Ecclesiastical Library. See Rambach, Geschichte der byzantinischen Literatur (1897); F. C. Baur, Die Epochen der kirchlichen Geschichtsschreibung (1892); L. Jeppe, Quellenuntersuchungen zu den griechischen Kirchenhistorikern (1884).

EVANDER. (Gr. Ευάνθις, “good man”), in Roman legend, son of Mercury and Carmenta, or of Echuesus, king of Arcadia. According to one account, Evander was the Arcadian tenant of Pallantium about sixty years before the Trojan War and founded Pallantium or Palatium on the hill afterwards called the Palatine. This is only one of the many Greek legends adopted by the Romans for the purpose of connecting places in Italy with others of like-sounding name in Greece. To Evander was attributed the introduction of Greek rites and customs into his new country; of writing, music and other arts; of the worship of Pan (called Apollo by the Italians) and the festival of Lupercalia. In Virgil he receives Aeneas hospitably, and assists him against Turnus. Probably Evander was identical with the god Faunus (the “favouer”), and the tale of his Arcadian origin was due to the desire to establish connexion with Greece; the name of his reputed mother (or wife) Carmenta is genuinely Italian. See Livy i. 6. 7; Ovid, Fasti, i. 471, v. 99; Dion. Halic. i. 31-33; Virgil, Aeneid, viii. 335.

EVANGELICAL ALLIANCE, an association of individual Christians of different denominations formed in London in August 1846, at a conference of over 900 clergymen and laymen from all parts of the world, and representing upwards of fifty sections of the Protestant church. The idea originated in Scotland in the preceding year, and was published “to associate and concentrate the strength of an enlightened Protestantism against the encroachments of popery and Puseyism, and to promote the interests of a scriptural Christianity,” as well as to combat religious indifference. A preliminary meeting was held at Liverpool in October 1845. The movement obtained wide support in other countries, more especially in America, and organizations in connexion with it now exist in the different capitals throughout the world. The object of the alliance, according to a resolution of the first meeting, was “to assist Christians to realize in themselves and to exhibit to others that a living and everlasting union binds all true believers together in the fellowship of the church.” At the same conference the following nine points were adopted as the basis of the alliance: “Evangelical views in regard to the divine inspiration, authority and sufficiency of the Holy Scriptures; the right and duty of private judgment in the interpretation of the Holy Scriptures; the guidance of the Godhead in the affairs of the world; the utter depravity of human nature in consequence of the fall; the incarnation of the Son of God, his work of atonement for sinners of mankind, and his mediatorial intercession and reign; the justification of the sinner by faith alone; the work of the Holy Spirit in the conversion and sanctification of the sinner; the immortality of the soul, the resurrection of the body, the judgment of the world by our Lord Jesus Christ, with the eternal blessedness of the righteous and the eternal punishment of the wicked; the divine institution of the Christian ministry, and the obligations and perpetuity of the ordinances of Baptism and the Lord’s Supper,” it being understood, however, (1) that such a summary “is not to be regarded in any formal or ecclesiastical sense as a creed or confession,” and (2) that “the selection of certain tenets, with the omission of others, is not to
be held as implying that the former constitute the whole body of important truth, or that the latter are unimportant."

Annual conferences of branches of the alliance are held in England, America and several continental countries; and it is provided that a general conference, including representatives of the whole alliance, be held every seventh year, or oftener if it be deemed necessary. Such conferences have been held in London in 1851; Paris, 1855; Berlin, 1857; Geneva, 1861; Amsterdam, 1867; New York, 1873; Basel, 1879; Copenhagen, 1885; Florence, 1891; London, 1896 and 1907. They are occupied with the discussion of the "best methods of countering infidelity, Romanism and ritualism, and the desecration of the Lord's Day," and of furthering the positive objects of the alliance. The latter are sometimes stated as follows: (a) "The world girdled by prayer"; a world-wide week of prayer is held annually, beginning on the first Sunday in the year. (b) "The maintenance of religious liberty throughout the world." (c) "The relief of persecuted Christians in all parts"; the alliance has agents in many countries to help the persecuted by distributing relief, &c., and in Russia there is a travelling agent who endeavours to help the Stundists. (d) "The manifestation of the unity of all believers and the upholding of the evangelical faith."

The following publications may be mentioned:—The Evangelical Alliance Monthly Intelligence, The Evangelical Alliance Quarterly, both published in London; A. J. Arnold, History of the Evangelical Alliance (London, 1897); and the reports of the proceedings of the different conferences.

**EVANGELICAL ASSOCIATION** of North America, a religious denomination, founded about the beginning of the 19th century by Jacob Albright (1759–1808), a German Lutheran of Pennsylvania. About 1790 he began an itinerant mission among his fellow-countrymen, chiefly in Pennsylvania; and meeting with considerable success, he was, at an assembly composed of adherents from the different places he had visited, elected in 1800 presiding elder or chief pastor, and shortly afterwards rules of government were adopted somewhat similar to those of the Methodist Episcopal Church. The theological standards of the two bodies are also in close agreement. In 1807 Albright was appointed bishop of the community, which adopted its present name in 1818. In 1816 the first annual conference was held, and in 1843 there was instituted a general conference, composed of delegates chosen by the annual conferences and constituting the highest legislative and judicial authority in the church. The members of the general conference hold office for four years. In 1891 a long internal controversy resulted in a division. A law-suit awarded the property to the branch making its headquarters at Indianapolis, whereas the other party, numbering 40,000, that met at Philadelphia, constituted themselves the United Evangelical Church. The Association in 1906 had about 105,000 members, besides some 10,000 in Germany and Switzerland, and has nearly 1200 churches and 1300 itinerant and other preachers. There are four bishops. It distributes much evangelical literature, and supports a mission in Japan.
